## how is qgis so far?

- ◇ what doesn't work?
- ◇ what shall i cover more/again?

# outline

misc

basics again

basic descriptive statistics

classification methods

thematic mapping

heatmaps

layers-properties: labels and metadata

## variable definitions...

- ◇ be very clear about what you are measuring
  - put it either on the map, or into metadata, or into “codebook” or into appendix
  - but have to have it somewhere !
  - eg do we have small breweries that are at some bars ?  
how exactly is a brewery defined ?
  - eg what is exactly a bike lane—do we include paths in parks?  
does it have to be designated for bikes only ?

## map labeling

- ◇ must have a legend
- ◇ must have a self explanatory title/caption
- ◇ self-explanatory means that if I give it to a random person that person will understand what is it about
- ◇ in other words it will pass “a grandma test”
  - give it to your grandma and she must be able to understand it
  - if she doesn't, then it isn't clear enough

# questions

- ◇ a question was how to deselect features:
  - there is a tool with red color for deselecting
  - let's select and deselect something

# outline

misc

basics again

basic descriptive statistics

classification methods

thematic mapping

heatmaps

layers-properties: labels and metadata

## why? it's a gis class

- ◇ important to know a little for understanding thematic mapping
- ◇ again, thematic mapping is about classifying values into bins
- ◇ it all depends on how the vales are distributed
- ◇ you need to know something about distributions
  - again: Properties-Style-histogram tab
- ◇ show side by side histogram with map in qgis

# skew

# income distribution

# outline

misc

basics again

basic descriptive statistics

classification methods

thematic mapping

heatmaps

layers-properties: labels and metadata

## references: very useful!

- ◇ let's open both and do 2nd pdf: 7,8: creating classes
- ◇ and then do each classification type one by one from BOTH docs
- ◇ [http://www.gitta.info/Statistics/en/html/StandClass\\_learningObject2.html](http://www.gitta.info/Statistics/en/html/StandClass_learningObject2.html)
- ◇ [http://www.ttu.ee/public/e/ehitusteaduskond/Instituudid/Teedeinstituut/Geodeesia\\_oppetool/oppematerjalid/thematic\\_map\\_design.pdf](http://www.ttu.ee/public/e/ehitusteaduskond/Instituudid/Teedeinstituut/Geodeesia_oppetool/oppematerjalid/thematic_map_design.pdf)

## **standardization-always think about the meaning**

- ◇ nj counties <https://drive.google.com/open?id=1xJDhcRCkgv7k4tNCa720og5bohV6dTB2>
- ◇ map POP2010: not meaningful (for most purposes) to rank U/As by population given the fact they differ in size
- ◇ most of the time you want to standardize by area (“per sq km”) or by population (“per capita”)
- ◇ or by specific area and by specific population
  - eg much of some area may be water or forest
  - similar with populations-they may only work or sleep in some area, (Cherry Hill is a bedroom city) etc etc
  - eg Cape May has many liquor stores per capita (just because nobody lives there)

## generate a new variable

- ◇ first duplicate the layer
- ◇ “Open Field Calculator”
- ◇ “Output filed name”: “pd10” [qgis doesn’t like long var names!]
- ◇ “Output field type”: “Decimal number (real)”
  - and bump up precision to say 10 (decimal points)
- ◇ calculate *POP2010/SQ\_MILES* (can select from variables drop-down)
- ◇ map it: equal interval, and compare to the original
- ◇ big difference—the county next to NYC is much more dense than everything else

## what do we see ? (the distribution)

- ◇ but wait ! this map is not very useful because there is not much variability in it
- ◇ this happens when data are skewed—the county next to NYC is much more dense than anything else (right-skewed, draw distribution)
- ◇ Properties-Style, “Histogram” tab, hit “Load values” (have window big or wont open)
- ◇ try more classes (draw eq. size bins on the distr)
- ◇ but even if we have 10 classes it doesn't help much
- ◇ better yet pick some other classification technique
- ◇ let's try NATURAL BREAKS (JENKS)

## level of analysis

- ◇ remember i was repeating myself over and over again that the level matters
- ◇ and that usually the lower (finer) the better
- ◇ and that the higher, the more information you loose
- ◇ here's an example

## level of analysis: example

- ◇ load NJ\_MUNIS
- ◇ and map with 5 quantiles POP\_DEN2010
  - a huge difference!
  - note many areas next to Philadelphia, NYC and some coastal areas
- ◇ the previous map did not showed that at all !
  - Only one county next to NYC showed up because it were small and ALL densely populated
- ◇ but the rest of the counties were densely populated only in few subareas

## classification methods

- ◇ again, always think hard about the distribution of a variable that you are mapping—histogram is one of the best tools
- should have the histogram in presentation/paper
- think about it hard, discuss, and do motivate classification technique!
- if not, i will cut off points!
- ◇ i like NATURAL BREAKS/JENKS or QUANTILES
- ◇ they usually show the data better than equal intervals
- ◇ start with many, say 10, and then see if you can shrink it to say 5 or 3 without losing too much information
- keep in mind graphing principles we covered last week: clarity and parsimony

## choice of classification method is critical

- ◇ try to be as objective as possible
- ◇ never choose a method that shows something that fits your story
- ◇ you are a scientist, you have to be objective
- ◇ explore the distribution; look at different ways of categorizing the values
- ◇ pick the one that is most parsimonious, yet it does represent what is going on
- ◇ let the data speak! do not force your story

## categorized symbology

- ◇ good for categorical data
- ◇ what are categorical data ?
- ◇ examples ?
- ◇ continuous vs ordinal, nominal (multinomial and binary)

## categorized symbology—how it works?

- ◇ you can specify your own symbols and/or colors for levels of a variable

## bring in universities

- ◇ load [https://sites.google.com/site/adamokuliczkozaryn/gis\\_int/hsip\\_colleges.zip?attredirects=0&d=1](https://sites.google.com/site/adamokuliczkozaryn/gis_int/hsip_colleges.zip?attredirects=0&d=1)
- layer-Properties-Style; select “Categorized”
- ◇ do CATEGORIZED classify by NAICSDESCR and pick some big symbol for “universities” level
- ◇ then we can easily see that there are only 2 universities in South Jersey...
- ◇ use the IDENTIFY TOOL (arrow with i) to see what they are
- ◇ Aha ! RU-Camden and Rowan—maybe then we should merge them...

## Contaminations Sites in New Jersey 1992

## contaminations

- ◇ this is a pretty good map!
- ◇ perfect size and color for contaminated sites!
  - doesn't overlap much but big enough to see
- ◇ so you could just do something like that and you are fine!
- ◇ but you can do something little more fancy
- ◇ and sometimes you probably have to do something little more fancy
  - that is when there are way too many points, like thousands...
  - well you could zoom in, but if you want to show the whole thing:
  - then do a heatmap!

## contaminations: too many points? heatmap!

◇ get

[https://docs.google.com/uc?id=1T\\_n1y\\_Mj5yQiWpZwrbuuFFwmIVJ2QWFZ&export=download](https://docs.google.com/uc?id=1T_n1y_Mj5yQiWpZwrbuuFFwmIVJ2QWFZ&export=download)

◇ load it and...we got a map

- but lots of points! make them smaller:
- under style, change size to say .4

◇ but better do a heatmap:

- right click layer-Properties-Style: Heatmap
- play with Radius to achieve desired heat
- (at home: overlay with county bounds etc to locate better)

layers-properties: labels and metadata

## what else under layers-properties?

- ◇ we've covered STYLE...
- ◇ let's stick in some LABELS
- ◇ can pick some of the text you get when you use IDENTIFY FEATURES TOOL
- ◇ from NJ\_COUNTIES display COUNTY\_LABEL
- ◇ select a “buffer” to have nice outline—easier to read
- ◇ note: can put as label any var, incl numeric, letter, etc!
  - so it is a way of having 2 vars in one map: thematic+label

## label only certain features

- ◇ can subset a shapefile, that is select features of interest and save them and load again and then label,
  - lets do it say with South Jersey
- ◇ or there is also another way: <http://anitagraser.com/2015/12/04/how-to-label-only-selected-features-in-qgis-2-8-and-up/>

# layers-properties-metadata

- ◇ remember i was stressing this is important
- ◇ metadata=data about data
  - U/A, num of obs, etc
- ◇ and for now we'll skip the other tabs...
