XXX TODO ADD TO EBIB AS KEYWORD PAPER-CODE-NAME AND TAG WITH EBIB KEYWORDS

The evidence of urban-rural happiness gradient is mounting. urban unhappiness is common and some morrison stuff and couple others like 10 from that boilerplate in recent cities article about least happy places around the world specific cities but guess The urban-rural happiness gradient states that happiness raises from its lowest in largest cities to highest in smallest places, little towns, villages, and open country.

Yet all studies to date are cross sectional and panel evidence is missing. Few studies that use panel data do not actually test the gradient. Hoogerbrugge and Burger (????) use inadequate measurement, the urban-rural cutoff is at extremely low population size of 10,000 people or even 3,000 people for Scotland. Large villages and small towns are not really "urban" lacking defining features of urbanness: size, density, and heterogeneity Wirth (1938). The build environment in small towns lacks . The way of life lacks transitoriness, etc these words from city book. cite when metropolis is too big and urban unhappiness is common—ideally it should be a gradient, and if necessarily a binary distinction then it is several hundred thousand, not 3 or 10 thousand as in Hoogerbrugge and Burger (????).

White et al. (2013b) and White et al. (2013a) use British panel (BHPS) but test green space (such as gardens, parks, and proximity to coast) not size of a place. Similarly, Alcock et al. (2014) is a panel (BHPS) but also examining green space, not size of a place. Rehdanz and Maddison (2008) uses a German panel dataset (GSOEP), but without panel modelling techniques such as fixed or random effects.

1 Data and model

We use 2009-2019 psid from `psidonline.isr.umich.edu`, the reason being that swb question only started in 2009. from the family files we only retain household reference person (or head as it used to be called). This is the same practice as in (Brown and Gathergood 0).

the swb question reads: Please think about your life as a whole. How satisfied are you with it? Are you completely satisfied, very satisfied, somewhat satisfied, not very satisfied, or not at all satisfied? on scale from 1 (low) to 5 (high).

and the key independent variable is metro as defined in table 1.

Summary statistics are shown in Supplementary Online Material (SOM).

There are 3 vars that not only predict SWB, but also are likely to be confounded with metro: race, political views, and religiosity—yet, they are irrelevant in fixed effects model as they are constant over time.

panel structure description of metro variable is shown in the appendix yes one problem is that there is little variability in urb-rur

*EMAIL: adam.okulicz.kozaryn@gmail.com

I thank Gordon D. A. Brown for sharing STATA code. All mistakes are mine.

metro	beale code	rural-urban	description
1	1		Metro: Counties in metro areas of 1 million population or more
1	2		Metro: Counties in metro areas of 250,000 to 1 million population
1	3		Metro: Counties in metro areas of fewer than 250,000 population
0	4		Nonmetro: Urban population of 20,000 or more, adjacent to a metro area
0	5		Nonmetro: Urban population of 20,000 or more, not adjacent to a metro area
0	6		Nonmetro: Urban population of 2,500 to 19,999, adjacent to a metro area
0	7		Nonmetro: Urban population of 2,500 to 19,999, not adjacent to a metro area
0	8		Nonmetro: Completely rural or less than 2,500 urban population, adjacent to a metro area
0	9		Nonmetro: Completely rural or less than 2,500 urban population, not adjacent to a metro area

Table 1: metro variable: Metropolitan/Non-metropolitan Indicator: This indicator is derived from the 2013 Beale-Ross Rural-Urban Continuum Codes published by USDA based on matches to the FIPS state and county codes: 1. Metropolitan area (Beale-Ross Code ER775923= 1-3); 0. Non-metropolitan area (Beale-Ross Code ER775923= 4-9). Each county in the U.S. is assigned one of the 9 codes.

controls are set in table ?? var_des in SOM

in controls we follow my cities when metropolis is too big (make sure we do):

race! cities more minorities and minorities less happy (berry US swb paper)

liberal democrat, rep con—cities more liberal/democract and democrats less happy my jap paper

it is imoportant to control for employment status—it both predicts swb, especially unemplyment has lasting negative effect on swb, and it also correlates with urbanicity as cities have more employment opportunities (e.g., O'Sullivan 2009).

boilerplate on linear models, no need for categorical dependent variable modeling, elaborate

a standard fixed effects model is given by:

$$SWB_{it} = \gamma METRO_{it} X_{it} \beta + \alpha_i + u_{it} \tag{1}$$

Where, $METRO_{it}$ is a metro dummy for person i at time t. γ is the main coefficient of interest. α_i (i=1...n) is the unknown intercept for each person(n person-specific intercepts). SWB is the dependent variable, where i = person and t = wave. X_{it} is a vector of control variables. β is the vector of coefficients for control variables. u_{it} is the error term.

A limitation of fixed effects model is that there are just 6 waves and tehre is limited variability across time and hence time-invariant variables cannot be estimated, notably on metro which is not that often changed

2 Resuklts

by wave each cross section just have in app and refer briefly, and re; in body only fe

Table 2: FE regressions of SWB.

[note: this section will NOT be a part of the final version of the manuscript, but will be available online instead]

3.1 Variables' Definitions

Table 3: Variable definitions.

name	description
swb	"Please think about your life as a whole. How satisfied are you with it? Are you completely satisfied, very satisfied, somewhat satisfied, not very satisfied, or not at all satisfied?" 1 (lo) - 5 (hi)
metro	"Metropolitan/Non-metropolitan Indicator. This indicator is derived from the 2013 Beale-Ross Rural-Urban Continuum Codes published by USDA based on matches to the FIPS state and county codes." 1 Metropolitan area (Beale-Ross Code ER775923= 1-3) 0 Non-metropolitan area (Beale-Ross Code ER775923= 4-9)
age	age
age sq	age squared
last year total family income	last year total family income
unemployed	EMPLOYMENT STATUS-1ST MENTION; We would like to know about what you do – are you working now, looking for work, retired, keeping house, a student, or what?—FIRST MENTION; 1="Looking for work, unemployed", 0 otherwise
male	gender
health	"Now I have a few questions about your health. Would you say your health in general is excellent, very good, good, fair, or poor?" 1 (poor) to 5 (excellent)
kids	"Number of Persons Now in the FU Under 18 Years of Age"
college	"Did (you/he/she) attend college?" 1='yes', 0='no'
married	"Are you married, widowed, divorced, separated, or have you never been married?" 1='married'; 0 otherwise
family unit size	Number of Persons in FU at the Time of the Interview
white	"What is (your/his/her) race? (Are you/Is [he/she]) white, black, American Indian, Alaska Native, Asian, Native Hawaiian or other Pacific Islander?—FIRST MENTION" 1='white', 0 otherwise
distress	The K-6 Non-Specific Psychological Distress Scale
