

# ps3; due in 2 weeks

[version: Tuesday 13<sup>th</sup> February, 2018 17:05]

Either use your own data or auto data [sysuse auto, clear](#) or data from previous classes.

1. produce some relevant descriptive statistics—submit interesting/relevant results, not all the permutations you can think of
2. we will run some models with dummies and interactions—ideally they should make sense—there should be some theory/logic for using a dummy and for interaction effect!
3. run at least 3 different models and at least one with more than one dummy from the same variable (eg dummy out a multinomial variable race into white, black, other) and at least one model with an interaction; needless to say, interpret results

---

general directions (always the same):

- if asked to do sth by hand and you subset your data to few obs to do that, say 4 obs, do all the other stuff like descriptive stats for the full sample—it is way more interesting!
- when doing things by hand, show all the work, all the steps
- make it as easy on yourself as possible: round up numbers! simplify!
- if you calculate any meaningful number, say slope coefficient or t-stat, always interpret it!
- preferably use txt or pdf formats; doc(x) often messes up formatting
- do not submit more than 10 pages of the output (12pt font, single spaced)
- submit into the Sakai's dropbox; ps are due by the beginning of the next class unless indicated otherwise, eg “due in 2 weeks”; late ps are not accepted; if your writing is legible you can write by hand and then take a picture and submit that
- we are on the way to developing the final project with these ps: as we progress, your ps should start resembling a coherent and logical project where you use regression to answer interesting questions—say in few sentences why are you doing what you are doing—that is, answer the “so what question”: what's the goal of all that, why are you doing this? you need a compelling justification for what you are doing; be brief, say couple sentences
- always submit dofile if you calculate anything in stata; because you are only submitting code (do not submit any datasets), it must load data from Internet—just put your data onto your own website, wordpress, google drive, etc
- always, cite your data (at minimum full name and url (if applicable))
