agency wvs

Adam Okulicz-Kozaryn*
Rutgers - Camden

Tuesday 8th September, 2026 11:32

Contents

1 sep2-8 going back to first regressions

1.1 sep7-8 met with leonie and refined

sep7 log TODO add here from gmail

cross-correlations: freedom/agency has highest correlations with satFin at .32 and health at .21; all others are below .1, highest being with class at .9

govRes has highest corr with satFin as well!! at -.14 and 2nd higest with freedom at -.09 and class -.08

*EMAIL: adam.okulicz.kozaryn@gmail.com

I thank XXX. All mistakes are mine.

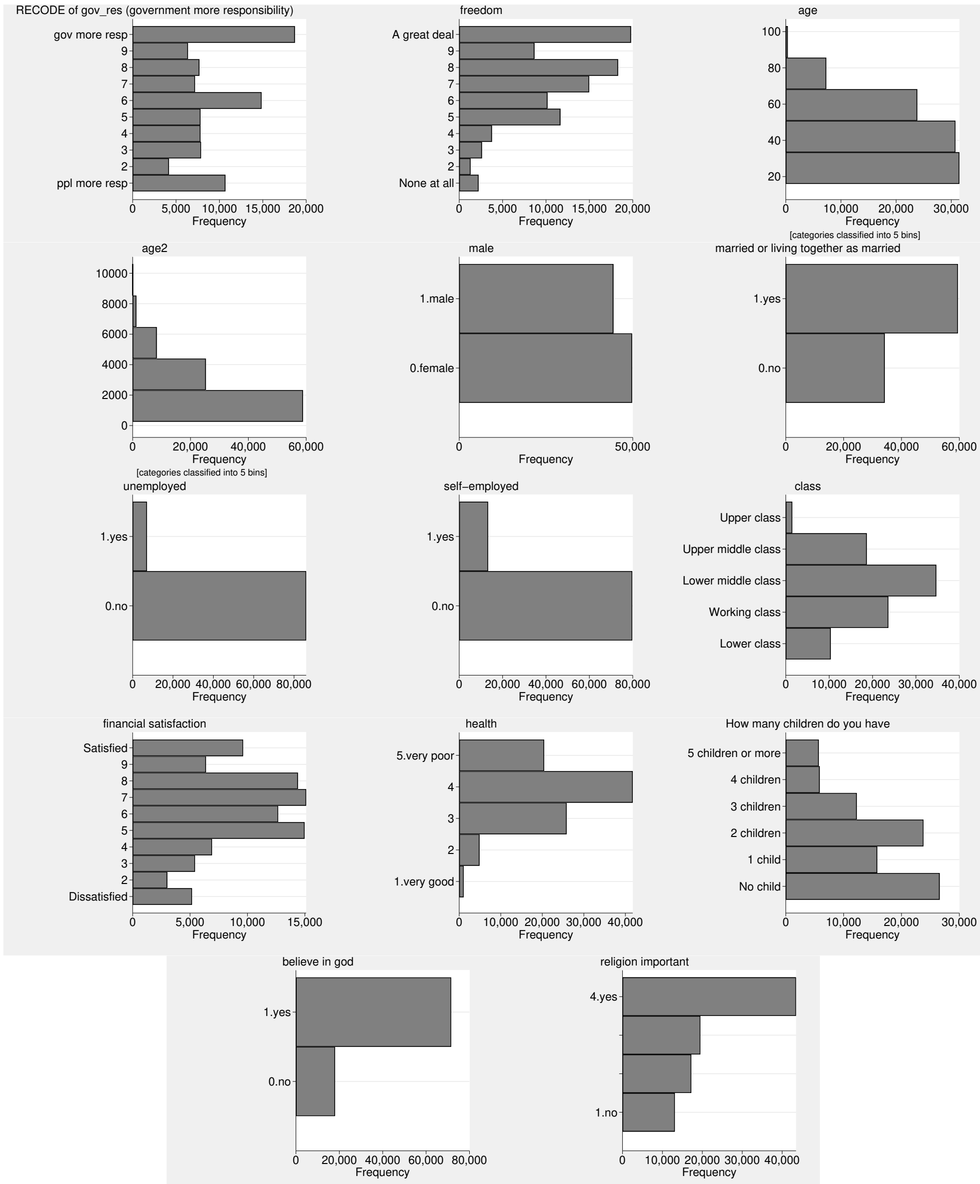

Figure 1: Variables' distribution.

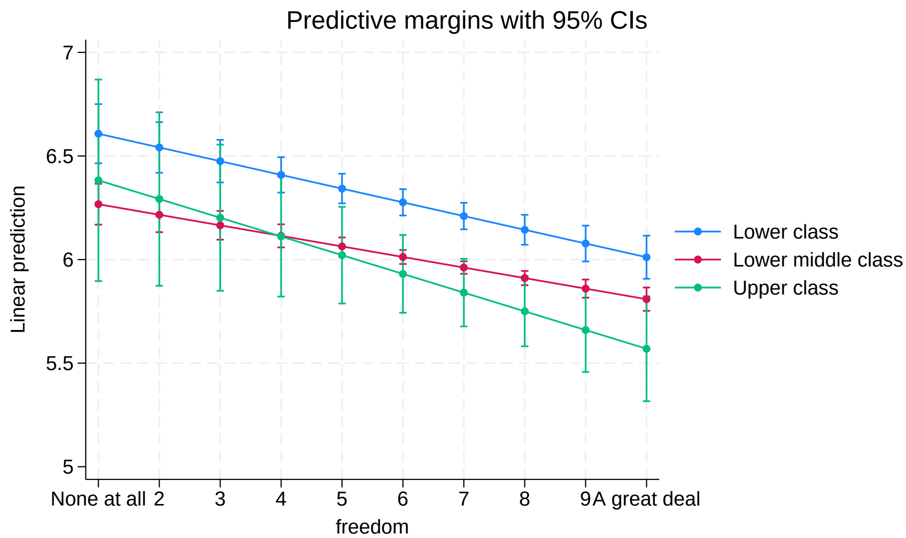

Figure 2: m-a6 not that much but a still a bit as with these cross cc interactoins fanning out abd in–it is for more alfuent ones more diff like inglehart graph

Table 5: OLS regressions of gov more responsibility (v ppl take care of themselves).

in tab 5 pov and infl insig; but: c2 gdp − on − freedom, so better conditions higher gdp more effect of freedom; and same thing (worse conditions less of effect): and both ineq and unemp + on − freedom/autonomy so kills freedom effect, more unemloyment less string effect of freedom; so kind of like le4onie's slides fanning out and in where the effects were stronger for better conditions; or again that inglehart graph survival v lifestyle in fig

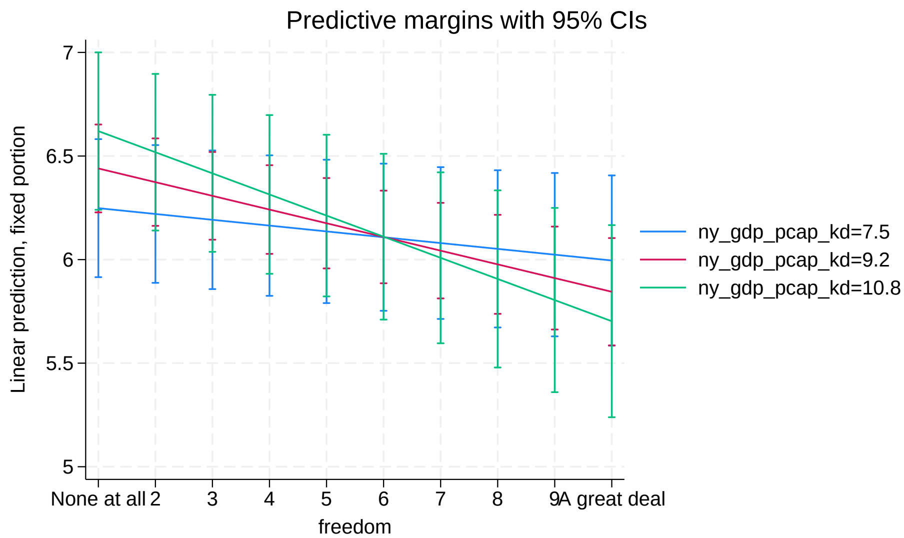

Figure 3: m-c2 gdp: ok like leonie presentation fanning in and out: higher gdp more effect

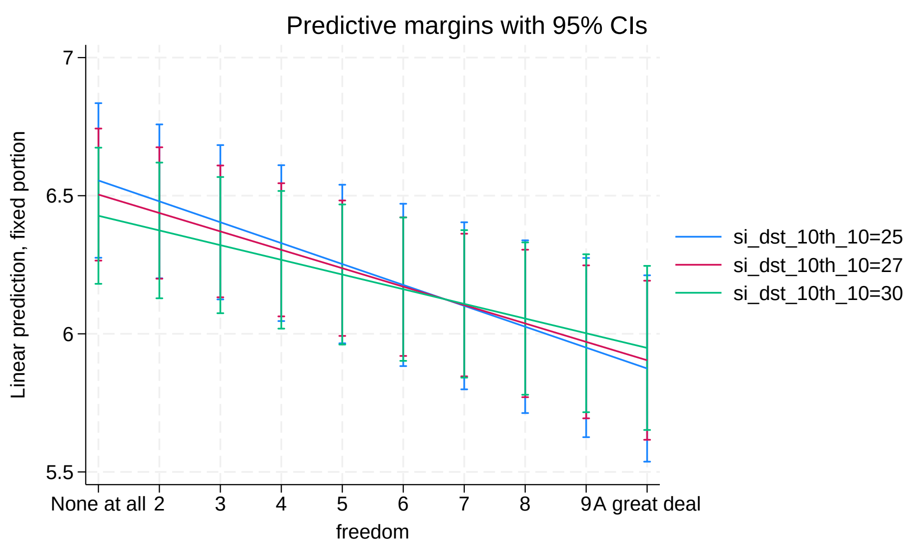

Figure 4: m-c4 ineq: ok like leonie presentation fanning in and out: higher ineq less effect

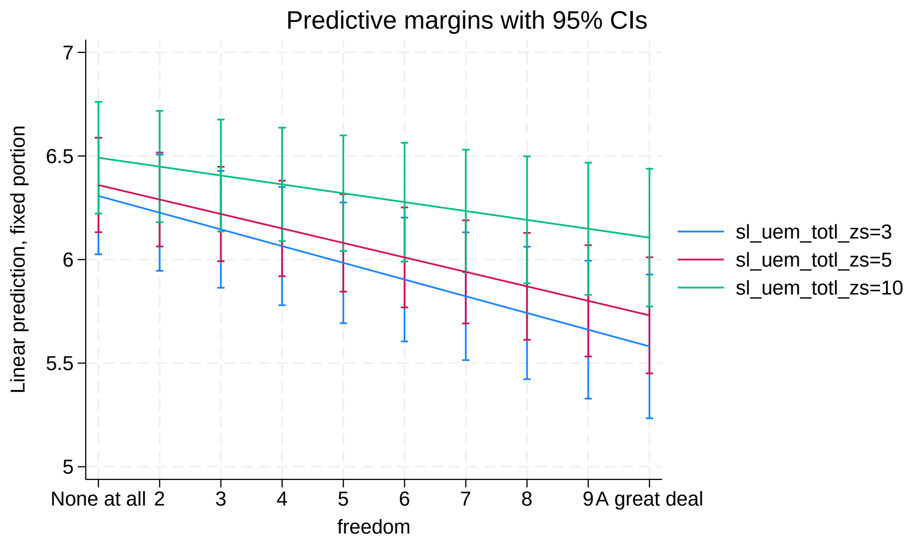

Figure 5: m-c8 unemp: ok like leonie presentation fanning in and out: higher unemp less effect

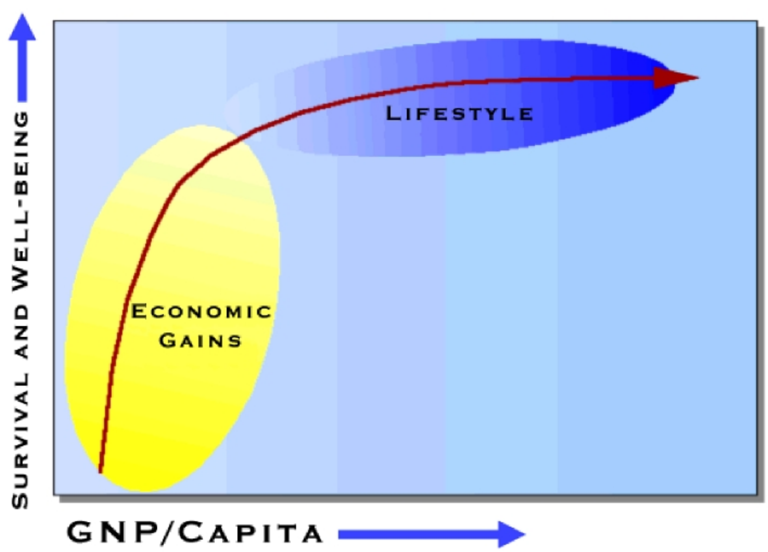

Figure 6: inglehart graph

1.2 pretty much final paper regressions: following hypotheses from paper draft

First in a1 bivariate, then in a2 addiing country dummies–slope on autonomy is attenuated, but not whole lot from -.13 to -.11. In a3 adding basic socio-demographics age gender and marital status attenuates the effect only slightly to -.1. Adding class and income in a4 cuts the effect size to -.08. And the biggest drop is for financial satisfaction in a5 down to -.05. And in a6 trying interaction with class, which is mostly insignificant. A7 is an overstaturated model with extra controls for health, kids, religiosity, and social capital/belonging to organizations/social groups–results do not change.

Whats noteworth is that the effect of freedom/autonomy is more than half of effect of income (a4: .08/.13, a6: .07/.10).

Table 6: OLS regressions of gov more responsibility (v ppl take care of themselves).

Then in table 7 we test for nonlinearities in freedom/autonomy by dummying ot the variable. And indeed there are substantial nonlinearities. In b1: there is not much difference bewteen the first step on freedom/autonomy (base case) and 2nd. And then there are big jumps throught up to 6th step, and then levels off and even drops for the 10th step. Adding county dummies in b2 attenuates the relationship, now no statistically significant difference among the first three categories, and then again as in b1 bigger jumps throught 6th step or even 7th step now and then it levels off slightly lower at just under 1, while earlier in b1 it was above 1. Adding basic sociodemographics in b3 doesn't change the estimates much. In b4 class and income attenuates the results further, and so does financial satisfaction in b5. B6 is an overstaturated model with extra controls for health, kids, religiosity, and social capital/belonging to organizations/social groups–results do not change.

Table 7: OLS regressions of gov more responsibility (v ppl take care of themselves).

Easier to see in a graph: marginsplot for b5 in 7: first 2 and last 4 flat, change in the middle-low values, and interesting little bump in 10th.

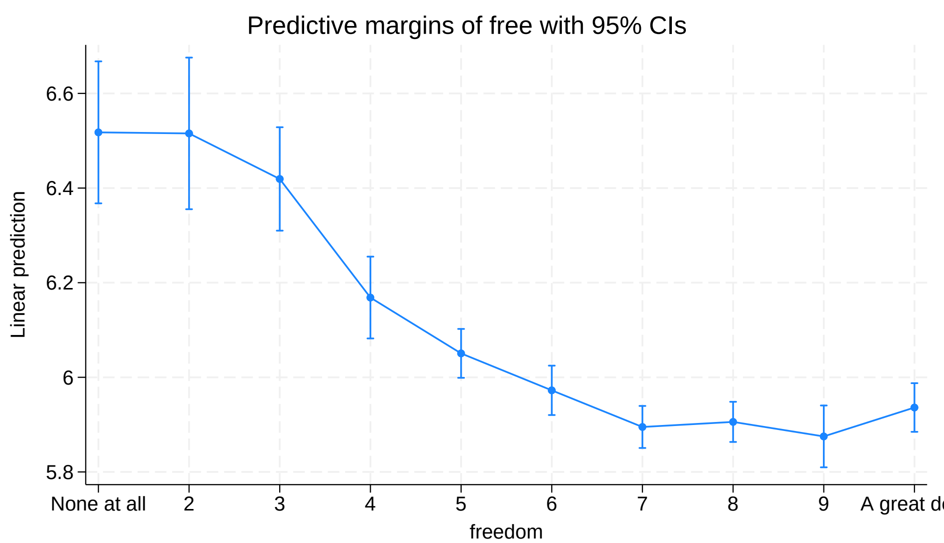

Figure 7: b3: interesting how non-linear it is–pretty much no difference for first 3 steps, then sharp dropoff from 3 through 6, and then again little diff 6-9; and then actually increase at 10!

and finally by country in table 8. First what is striking is that there are some positive values: BRA, JOR, LBY, and SRB, most are negative at -0.1, but some are lower at -0.2: AUS, BGD, KEN, NZL, and USA and even lower at -0.3 LBN

BRA stands out as large country and positive effect. DEU likewise, large but no efect (and large estimates on dummies). Germany's neighbor AUS on the other hand yes large negative effect -0.2. ARG, BRA neighbor negative effect like most countries. CAN a large country, no effect in contrast to its neigbor USA with large negative effect. LBN stands out with very large effects especially visible on dummied out freedom, but some other coutries have some large dummies as well: BGD, COL, CYP, CZE, DEU (throught), GRC, GTM, HKG, IDN, KAZ, KEN, KOR, LBN, MAC, MNG, NZL, PHL, PRI, THA, TUN, TUR, URY, and USA (interestingly neg val on top and bottom one)

Table 9: [appendix only] OLS regressions of gov more responsibility (v ppl take care of themselves). Using model b5 from table 9.

and last cross lev interactions , first with affluence in columns c1 and c2: "H2: This impact is stronger in more affluent societies, more unequal and less trusting societies." Inequality in columns c3 and c4–opposite to what expected, the higher the inequality the smaller the effect, but the effect size is closer to 0 and smaller than that of gdp in c1 and c2. Likewise with trust in c5 and c6 opposite to expected, and here the effect is also stronger.

2 feb21 [post-meet] some more results

2.0.1 quick/lose ideas and comments on pptz and doex in goog drive; some todos and maybe paper idea

```
GovRespAutonomy.pptx

P1 on liberated side add humanists and Frankfurt school:
Maslow, Fromm,  Marcuse

And it's also urban v rural eg simmel metropolis and mental life, toennies gemeinachaft/gesselschaft

And Marx's alienation:
https://theaok.github.io/docs/colQolSwb.pdf
"3.3 Theory of Alienation"

P6 'The autonomous individual' love the slide great points reminds me of Michael  slides with agency definitions

S7 bright side--could add Eudaimonia perhaps; self actualization maybe; and
maybe maybe (as you also cite toqueville) it could also relate to protestant
work ethic, higher gdp, creativity innovation (Richard Florida) etc

S8 dark side; "the autonomous asshole" musk, thiel, trump, narcissistic with
little empathy, pride with little shame and guilt, not humble

And Fromm escape from freedom: freedom can be difficult, it's burden in sense it
strips security and traditional social bonds
```

And actually modernity while it liberates say v feudalism, it also oppresses:
Freud civilization and it's discontents: modern/western civilization suppresses humanity

The social cage by Alexandra Maryanski:
Humans have natural preference for autonomy, freedom, and choice, and yet we are trapped in the "cages" of rigid social structures--yes especially agrarian and horticultural societies, but also now (v hunter gatherers)

And somewhat related res by p k piff--succesful ones attribute success to themselves not the society; monopoly experiment

!!PAPER IDEA!!
P9 Research Questions
'Is rising autonomy accompanied by a decline or rise in preference for government responsibility?'
This implies time but we mostly have cross sections in wvs, can do waves, and maybe relate freedom from(negative, freedom house, Fraser index, etc) to freedom to (positive, our WVS item)--are societies that went up on first freedom also up on second?so a panel version of my
https://theaok.github.io/docs/free_from_to.pdf

P12. Data and Measures
Important to add health: both predicts + autonomy and probably - govRes; so critical to control as per SIR editorial Bartram argues to control for predictors of main IV! And need literature about what predicts autonomy and redistribution (alesina wrote a lot)

S14 Country-level correlations and trends
Trend is great but should do by ctry, and I'd add negative freedom and focus on cases where there was big increase. Cross country is great but need to reformulate q1 to cross sec, not time-series

S15, Country-level changes
Id flip dv with IV
And again maybe add neg freedom. And could lag to tease direction. Eg neg freedom as ecological framework can drive personal preferences for redistribution (govRes), but also personal preferences can drive societal framework. There are theories to support both, I have a student doing dissertation on abortion preferences and abortion policy can ask her for opinion/preferences-policy theories

P17Individual-level associations
Id treat autonomy as categorical not continuous as I was getting in my regressions, just dummy categories out

And we need effect sizes, are these big? Say as important as income or health etc?

P18 country by country
Love this! Yes I was finding BRA positive too, have to ask my Brazilian collaborator Rubia valente about this. Second positive is POL need to think about it. One thing about POL (and other eastern Europe) is that it changed a lot from social collectivist laid back to capitalistic stressed etc so would be cool to zoom in over time!

And in general think about groups of countries here, any geog patterns
Low: Scandinavian and east north, and capitalistic US and Singapore; hi lat am but also Eastern Europe

geog maps like these inglehart-welzel maps:
https://en.wikipedia.org/wiki/Inglehart%E2%80%93Welzel_cultural_map_of_the_world
And that graph over time self actualization:
Fig1c:
https://scholarship.libraries.rutgers.edu/esploro/outputs/acceptedManuscript/Livability-and-Subjective-Wellbeing-Across-European/991031549915704646

P21 cross level interactions, your country n=48, should be at least 70, probably country missing data, just take average of 10yrs and or impute

Again relax assumption of linearity:

Instead
c.autonomy##c.countryVar
Do:
i.autonomy##c.countryVar

Being devil's advocate: maybe it's not autonomy but something close that both drives it and preferences for redistribution:
-personal responsibility, (protestant) work ethic, hard work, etc
-Succees, eg income satisfaction does make results weaker and arguably predicts both autonomy and preferences for redistribution
-personality, and I saw some vars in WVS I think
-culture, individualism v collectivism, nature mastery, power distance, etc

Again need to see papers for predictors of preferences for redistribution (alesina again)

The.dark side of autonomy 2 pptx

I started with this one and modeling my analysis after this incl vars, and have some more vars ideas in Feb 20 sec of som.pdf

MPI Praesi pptx

I like intrinsic instrumental moderating

I like controls health disability social connectedness

"Evaluate current economic system as fair" sounds like system justification theory Napier and Jost

State of the art docx

Just Some nuances maybe to think about, overall makes sense and agreed

"While lower-class individuals' orientation toward the world is characterized as more contextual and externally oriented, upper-class individuals' orientation is more solipsistic and individualistic." --Then difficult to explain why Latinos so high on autonomy as there is mostly shades of poverty, very little middle class and miniscule upper class

'The lives of lower-class individuals are often characterized by diminished resources and greater uncertainty (e.g., unsafe neighborhoods, job insecurity), which constrain opportunities and freedom of choice and make them more exposed to--and dependent on--external influences outside their control"-- but many poor are quite well socially connected help each other, while take US middle class disconnected socially and alienated like take for instance US suburbs--fake, alienated, stressed, etc

Yes totally lower classes do seem to be way more communal and prosocial.

"[The question now is: is it the material circumstances that shape the link between social class and economic attitudes or is it the autonomy that people have over their lives?]"--right need a bunch of controls

"social class position is not necessarily determinative of individuals' sense of control, power, and autonomy (Kraus et al., 2010). A lower-class individual can thus still perceive a substantial degree of autonomy to lead a life in accordance with their goals and values and may also exercise power over others, for instance in their occupation" yes exactly eg poor autonomous happy farmer or fisherman v rich alienated stressed manager

See if can control for occupation or industry

3 feb19 [meet] revisit: more useful vars; initial results

3.1 vars

freedom/autnomy:

A173 How much freedom of choice and control

Some people feel they have completely free choice and control over their lives, while other people feel that what they do has no real effect on what happens to them. Please use this scale where 1 means "none at all" and 10 means "a great deal" to indicate how much freedom of choice and control you feel you have over the way your life turns out.

maybe these ones in the future [all waves]? not for now missing (or very few maybe) in wave7

```
"People have different views about themselves and how they relate to the
world. Using this card, would you tell me how strongly you agree or disagree
with each of the following statements about how you see yourself?  I see myself as an autonomous individual; 1 Strongly disagree; 4 Strongly agree"
-------------------------------------------------------------------------------------------

Table 13: OLS regressions of gov more responsibility (v ppl take care of themselves).

a1: ok more autonomy by 1 on 1-10, want less redistr by .13 on 1-10 scale

a1cc: adding country dummies doesnt change anything

a1satFin: reduced by almost half!, note satFin correlates with agency at .33

a2: basic sociodemographics, and effect size still large at .1

then interactions: [**TODO** marginsplot whats net, non-interacted terms large coeffs]

a3: freedom $*$ financial satisfaction–interesting while satFin alone less redistribution; interacted with autonomy, the more preRed

a4: with income also positive [rich assholes more for redistribution?]

a5: nothing with male [aggresive males more for redistribution?]

Table 14: OLS regressions of gov more responsibility (v ppl take care of themselves).

one contribution to dummy out like in my papers :)

easy to see big effects by 1 on over 5 or 6 on free–over 5 smaller changes, also first three almost no change, and then jump at 4 and then some on 5 snd 6–shows nonlinearity; and i guess also confirms leonie's point of "double barreled" ie can split in half autonomy var, and here this shows that it splits about in half at 5 or 6

b2: still around 1

b3: lower, but .7 is sizeable

3.2.1 by country

i'm a geographer so lets do by country

interesting thing i found in my freedom from and freedom to paper 10 years ago is that more freedom/autonmy in MEX than USA, but can also do effects by countries

another contribution by c, like my cities paper: `https://www.sciencedirect.com/science/article/pii/S0264275121002687?via%3Dihub`

here a quick exercise, just separately by capitalistic/alienated/western c about .15-3 v humanistic/social/latin c about 0-.1–clear differences 4 fold! say .5 v 2; and they hold controlling for basic sociodemographics

some surprises: in BRA positive!; DEU close to 0, but not in AUS; european ARG close to capitalistic/west; and LBN and CZE big for some reason like .3

```
