

Happy Colombia, Unhappy Bogota

Adam Okulicz-Kozaryn*

Rutgers - Camden

Wednesday 23rd November, 2022 07:33

Graphical abstract:

Figure 1: Urban-Rural happiness gradient endpoints. Note that the gradient has multiple steps as illustrated with frownie and smiley emojis, but for simplicity only end points illustrated with photos: very rural v very urban (more photos would make them small and illegible). Rural Salento (flickr.com/photos/pedrosz/9515685099), and Bogota Centro (commons.wikimedia.org/wiki/File:)

We study urban-rural Subjective WellBeing (SWB) differences, aka urban-rural happiness gradient, in Colombia. Vast of majority of the research on urban-rural SWB differences are in global North. This is one of the first studies in global South. Colombia, a developing country, is expected to have little evidence or urban-rural gradient observed in developed countries—cities promote economic growth needed in developing countries, and thus, may not be distinctively unhappy as in developed countries. Yet, we do find evidence of urban-rural happiness gradient in Colombia, especially Bogota, the largest Colombian city, 8m, is less happy than rural Colombia.

XXX TODO ADD TO EBIB AS KEYWORD PAPER-CODE-NAME AND TAG WITH EBIB KEYWORDS CP FROM URBN UNHAPPINESS IS COMMON

"The more densely populated our cities become, the more our lives are characterised by feelings of isolation and loneliness."
<http://pubs.socialistreviewindex.org.uk/isj79/cox.htm>

Intro

Colombia is a fascinating place for happiness research—unlivable but happy—it ranks as one of the happiest countries in the world despite having low to moderate economic development, much poverty and inequality CITE my swb qol paper.

then in poorer countries less of an urban penalty of urbanism CITE unhappiness is common or even a premium, say in african countries GLAESER, then question is what is it in colombia, still poor, and unequal—stats from col qol swb, and income varies across

*EMAIL: adam.okulicz.kozaryn@gmail.com

I thank XXX. All mistakes are mine.

space, have like gdp per capita by department– GDP per cap, PPP, USD: Bogota, Meta, and Santander are >20k, while Amazonas, Narino, and Choco are >7k–threefold difference, see SOM for details. So perhaps livability or quality of life in the poorest areas is not enough to provide environment for high happiness?

On one hand, as in the developed countries CITE unhappiness is common, there may be happiness penalty for the very largest cities such as Bogota, and perhaps Medellin and Cali. On the other hand, we know that cities promote economic growth glaeserTriumph and osullivan textbook– eco dev first as per figure 2 then lifestyle, so maybe actually big cities happier? 2

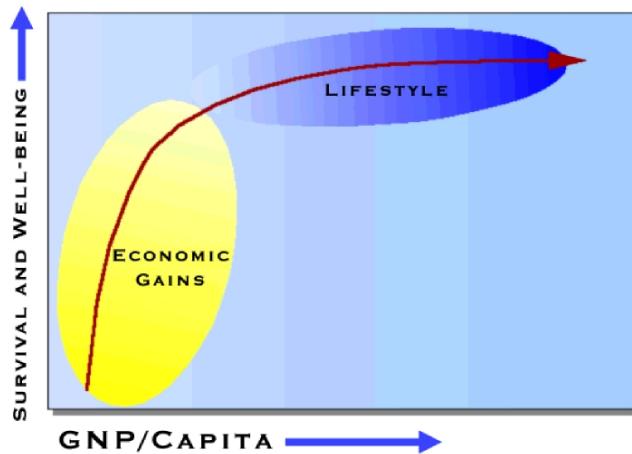

Figure 2: Well-being and income, (Inglehart 1997).

Most happiness studies are in global north, and the field is still only emerging in Latin America Rojas (2015, 2019). Carol Graham was an early student of latin happiness, yet her studies are in general about the continent, they do not focus on ColombiaGraham (2015), Graham and Felton (2006), Graham and Pettinato (2002, 2001)¹

There are cross national studies focusing on happiness that include colombia (e.g., Okulicz-Kozaryn and Valente 2021) or latin american studies (e.g., Valente and Berry 2016), but they do not focus on colombia and gloss over. Extant literature does not address Colombian intricancies.

Burger et al. (2021) is an exception in its sub-country look at regional happiness, but it uses questionable Gallup data—for problems with Gallup data see Okulicz-Kozaryn and Valente (2021).

Urbanism in Colombia

Colombia is a large country at about 52m, third largest Latin country (after Brazil and Mexico). Colombia is urbanized as much as the US at about 80 percent, its urbanization pattern is similar to overall Latin American one, except that it started more rural in 1950 at about 33% (LA at 40%), by 1975 both at 60%, in 2000 about 75%, and projected about 90% by 2050 (population.un.org/wup/Country-Profiles).

Yet the UN/WB definition has urban-rural cutoff very low, if looking at medium and large cities >.5m v elsewhere, only about 20m out of about 50m colombian population live there, less than half.

It is crucial to treat urbanicity or urbanness as a gradient/degree, not binary/dichotomy. Metropolis of 5m is very different from city of 500k and town of 50k is very differnt, too. The built environment varies dramatically: from sprawling hundreds of square kilometers with towers, subway, large airport in a metropolis to walkable from end to end several square kilometers mostly two or three stories. Way of life varies dramatically, too: from hectic, impersonal, and anonymous in a metropolis to slow paced, personal, and

¹Krauss and Graham (2013) is an exception, but they focus on labor market, not geography.

knowing people on the streets town.

Density is important, and carries valuable information, population size is also a function of arbitrary administrative boundaries. Density comparable to that of Berlin at 4k and about a quarter of that of Seoul or Barcelona at 16k² Another way to measure density is to use built-up area per cap—see last column in table 1.

Table 1: 10 largest Colombian Cities. Data source: population, density: latest available year, 2002-2021 <https://unstats.un.org/unsd/demographic-social/products/dyb/dybsets/2021.pdf>; built-up area per cap: 2015 <https://data.unhabitat.org/datasets/GUO-UN-Habitat::11-3-1-land-consumption-rates-in-colombia/about>

rank	city	population (millions)	density (thousands per sq km)	built-up area per cap (sq m)
1	Bogota	7.8	4.8	40
2	Medellin	2.6	6.6	39
3	Cali	2.3	4.1	45
4	Barranquilla	1.3	7.8	60
5	Cartagena	1	1.8	45
6	Cucuta	.8	1	76
7	Soacha	.8	4.2	38
8	Soledad	.7	1	34
9	Bucaramanga	.6	4	51
10	Ibagué	.5	.4	55

What's clear from table 1 is that Bogota is a category of its own, while similar in density to other large cities, it is about 3x larger than 2nd and 3rd Medellin and Cali, which would be another category about 2x larger than 4th Barranquilla. We will focus here on 3 categories of cities: 1) Bogota; 2) Cali and Medellin; 3) other cities larger than about .5m as listed in table 1. The authors visited personally all three largest cities, Bogota feels North-Western not only in climate but also in attitude and behavior, fast paced, stressful. Cali is the most Latin of the three cities, and Medellin seems to merge reasonably well edcomic development and organization but yet does not appear stiff and stressed like Bogota. Smaller places such as Popayan, Pasto appear warmer and more welcoming and happier than Bogota. Bogota doesn't feel like Colombia, it feels like a Western city, say Philadelphia or London, rushed and stressed.

1 Data and methods; REPHRAZE! copied from earlier

iii

We use www.worldvaluessurvey.org, which is representative of about 90% of the world population,³ and as elaborated in previous section, is much better suited for the study than an inadequate and poorly designed Gallup data. The variables are listed in table 2. Country codes and descriptive statistics are in SOM (Supplementary Online Material).

SWB question reads "All things considered, how satisfied are you with your life as a whole these days? Using this card on which 1 means you are "completely dissatisfied" and 10 means you are "completely satisfied" where would you put your satisfaction with your life as a whole?"

Urbanicity is operationalized with WVS variable X049—note that it is objective and recorded by reviewer, not respondent. There are eight categories ranging from '< 2k' to '> 500k.' This is important advantage, because as elaborated earlier, urbanicity or urbanness is a continuum, not a binary urban v rural. We conduct the analysis using a set of dummy variables for all eight categories (leaving out the base case) in the SOM. However, for simplicity and ease of exposition we present simplified results in the body of the paper using

²Same source as in table 1: <https://unstats.un.org/unsd/demographic-social/products/dyb/dybsets/2021.pdf>. But note that using night time satellite imaginary densities of Bogota, Cali, and Medellin are quite high at 20k, severalfold higher than Quito at 6.5k or Lima at 11k (?). Also note an useful distinction can be made to distinguish between core and satellites—see table 1 in ?. Un Habitat World Cities Report 2022 scores cities in terms of housing, sanitation etc at https://unhabitat.org/sites/default/files/2022/06/wcr_2022.pdf.

³While WVS is conducted in about 100 countries that represent about 90% of the world population, due to missing data for the particular variables of interest, the present's study coverage is slightly smaller, about 70 countries (depending on the model and specification).

three categories only. In other words, this study will use 8 categories of urbanicity, and summarize results for ease of presentation with 3 categories.

Because in many countries, there are either no observations or few observations in the first two bottom categories -2k and 2-5k, we combine them together for the analyses in the main body of the paper. These two categories together proxy free of city natural environment most closely resembling human natural habitat where we have evolved, and it includes: wilderness, open country, and small villages. The other critical category that must be measured based on earlier review of theory is large cities, again, there is likely to be a threshold at several hundred thousand, hence we use the top category on WVS variable X049 '>500k' to proxy large cities. Such places, are the least resembling of human natural habitat and are mostly consisting of man made objects such as asphalt, concrete, glass, etc, and as per theory as reviewed earlier, are likely to be least happy. The third category in our main analyses are places in between, 5-500k.

wvs boilerplate (bash gallup) and ols boilerplate

As Davies (2015) put it, it's not happiness research, it's "happiness industry." There are multiple problems with Gallup data. First, it is not meant for research but for commerce—Gallup charges \$30,000 for access (per one year!). (author's email inquiry)

—private corporations are making fortune from tax dollars and students tuition—scholars should resist corporatization of academia (Mills 2012a, Cox 2013, Mills 2012b, Catropa and Andrews 2020, Schmidlin 2015), and corporatization of happiness research (Davies 2015).

Second, urbanicity classification is twofold less precise than in WVS: 4 v 8 categories. Third, while WVS uses precise population size numeric cutoffs, Gallup uses fuzzy concepts such as "rural area", "small town or village", "large city". Fourth, (and this compounds third problem) Gallup uses self-reports of urbanicity, which is highly subjective and problematic in this case—many, if not most people, would likely classify themselves completely arbitrarily into "rural area" v "village" and so forth. WVS uses interviewer's information about the place. Fifth, apparently much of data are missing—Easterlin et al. (2010) notes that in 14 countries "rural area" responses were exceptionally low. Also, about half of the world population is urban, but Burger et al. (2020) reports that in their dataset only about quarter of respondents report rural residence.

Table 2 lists control variables used in the body of the paper.

Table 2: Variable definitions.

name	description
age	age
age2	age squared
male	male
married or living together as married	"Are you currently(READ OUT AND CODE ONE ONLY) 1 'Married' 2 'Living together as married' 3 'Divorced' 4 'Separated' 5 'Widowed' 6 'Single/Never married' 7 'Divorced, Separated or Widow' 8 'Living apart but steady relation (married,cohabitation)'"
divorced/separated/widowed	"Are you currently(READ OUT AND CODE ONE ONLY) 1 'Married' 2 'Living together as married' 3 'Divorced' 4 'Separated' 5 'Widowed' 6 'Single/Never married' 7 'Divorced, Separated or Widow' 8 'Living apart but steady relation (married,cohabitation)'"
health	"State of health (subjective)"
class	"Social class (subjective)"
education	"Highest educational level attained"
income	"Scale of incomes"
Employment status	"Are you employed now or not? IF YES: About how many hours a week? If more than one job: only for the main job 1 'Full time' 2 'Part time' 3 'Self employed' 4 'Retired' 5 'Housewife' 6 'Students' 7 'Unemployed' 8 'Other'"
religious services	"Apart from weddings, funerals and christenings, about how often do you attend religious services these days?"
Religious denomination	"Religious denomination WVS: Do you belong to a religious denomination? In case you do, answer which one. EVS: Which one?"
victim of a crime last year	"Have you been the victim of a crime during the past year?"
freq felt unsafe from crime at home	"In the last 12 months, how often have you or your family: Felt unsafe from crime in your own home "

In choice of controls we generally follow (Okulicz-Kozaryn and Valente 2020). There are specific controls worth discussing. Young, single and childless persons and young men with tertiary education are relatively more satisfied with urban areas as place of residence (Carlsen and Leknes 2019). Income, class, and education are important controls—not only predict greater SWB, but are also confounded and higher in cities.⁴

One great advantage of city living that is often forgotten is freedom “City air makes men free (Stadt Luft macht frei)” Park et al. ([1925] 1984, p. 12)⁵, hence we control for freedom.

Likewise, trust is important, it predicts SWB, and it is lower in cities (Milgram 1970).

Health is a key predictor of SWB, and also note that subjective health measure used here is a reasonable measure of actual health (Subramanian et al. 2009).

We use a standard OLS regression with robust standard errors. We treat the 10-step happiness variable as continuous. Ordinal happiness can be treated as a continuous variable (Ferrer-i-Carbonell and Frijters 2004). OLS has become the default method in happiness research (Blanchflower and Oswald 2011). Theoretically, while there is still debate about the cardinality of SWB, there are strong arguments to treat it as a cardinal variable (Ng 1996, 1997).

Using region/province variable X048WVS and 500,000 top bin population cutoff we were able to identify Colombian largest cities ($> 500k$ in WVS data as they uniquely fall in different provinces.⁶ Then we simply replace top $> 500k$ category in WVS data with dummies for each of the largest cities.

⁴where i discuss controls in data and to literature where i slam burger and indeed as shown later comparing unadjusted means results in cities being happier notably due to confounding of higher income education and class—see appendix for tables with and without controls

⁵It originated in the Middle Ages, and it meant freedom from feudalism, non-feudal islands in a sea of feudalism (Harvey 2012).

⁶Baranquilla and Soledad are exception as they both are Atlantico province, but they border each other and we simply treat them as one large city coded as Baranquilla.

2 Results

The regional exploration is preliminary and postponed to appendix in sec 4.

in tab 3 Bivariate model a1, no difference across urbanicity. This is important. As argued in urb undhapiness is common looking at simple mean differences may not reveal the urban-rural happiness gradient—notably, and especially in developing countries, cities are economic engines, and income is badly needed for necessities in developing countries and there is more opportunity in cities and so this confounds with urbanicity and results in nil relationship.⁷

Adding basic sociomegraphis in a2, likewise no difference. Adding health, class, and edu in a3 only slightly changes. But addition of income in a4 changes it. so with income it is sig! but not without! ppl go to city for inc (cite) higheer there, but confounds, witout accounting for it no diff.

and in a5 oversaturated with extra vars not much change

a5a adds crime as key urban problem; magnitude changes only slightly but become insig as sample size is reduced by almost half, yet the reduction is due to neg impact of crime, not due to the sample size—a5b reruns a5 except on sample from a5b and it is significant negative on 500k-

same motivation: urban rural gradient almost only solely in global north; rare exception rubia paper and shourjya

Table 3: OLS regressions of life staisfaction.

do note that in specification a1 no happiness gradient—Okulicz-Kozaryn and Valente (2021)—this is a typical result, gradient only arises controling for socio demographics, eg income, education, and social class get confounded with urbanicity.

in table 4: notably bogota, but also cali less happy than smalest places; not medelin the second largest; actually medelin adn cartagena have very small positive coefficients (but insignificant).⁸

⁷likewise irt is important to contril for city disamenities, notably crime

⁸We refrain from interpreting coefficients on "Cucuta," "Bucaramanga," "Ibague" as there are only 24 observations for each of them.

here in table 4 as opposed to 3, even in model 1, without controls, there is already a significant difference for Bogota—it is less happy than smallest areas even without controlling for predictors of happiness.

3 Discussion and Conclusion

AND ABS We do find a substantial effect size, of about .3 for cities $\geq 500k$, and .5 for Bogota. The evidence for the gradient, however, is weak. This is consistent with previous research showing that while in general there is a happiness gradient rising from low happiness in large cities to high happiness in rural areas, the largest happiness difference is between the largest cities v all other areas, ie cities bigger than several hundred thousand experience the largest happiness penalty (?).

Colombia is still being haunted by violence and conflict, much of which is rural (hrw.org/world-report/2020/country-chapters/colombia), and so in that respect it is notable that rural is happier than urban.

big city gives exposure to more comparisons, and as people tend to make upward comparisons (Frey and Stutzer 2002, Frey et al. 2008), it may result in relative deprivation and lower happiness, just as neighbors act as negatives (Luttmer 2005) incidentally, there is a similar hint from another area in colombia: inhabitants of poor municipalities in the choco are happy to know only that environment in which they were born and raised, but when they know and live in other municipalities with greater socio-economic development their demands and expectations increase (Muñoz-Cardona 2018). In other words, ignorance may be a bliss.

⁹Note that Ibagué and Bucaramanga have large negative coefficients about as large as Cali, even close to Bogota, depending on specification, but insignificant—one reason being that there are few observations for these cities.

Future research can use Colombian data to explore further, e.g., Como Vamos data Martínez et al. (as described in 2015), and government data:

<https://www.dnp.gov.co/Paginas/DNP%20reveala%20primer%20diagn%C3%B3stico%20de%20felicidad%20para%20Colombia.aspx>

<https://www.dane.gov.co/index.php/estadisticas-por-tema/pobreza-y-condiciones-de-vida/calidad-de-vida-ecv>

4 Author's Personal Observation on Bogota

I never look forward to visiting Bogota, it's a necessity as per central place theory, airport rare goods such as cigars etc. And it's not just build environment, asphalt, concrete, glass, ie city, that's depressing, it's people too, urbanism is a way of life with. Otherwise relaxed positive forendly colonists are now acting closer to stressed, cold, and unfriendly Philadelphians) replace with any other big city)

TODO: have separate som-r.tex as opposed to having it below; and in paper say see supplementary material as opposed to see appendix!

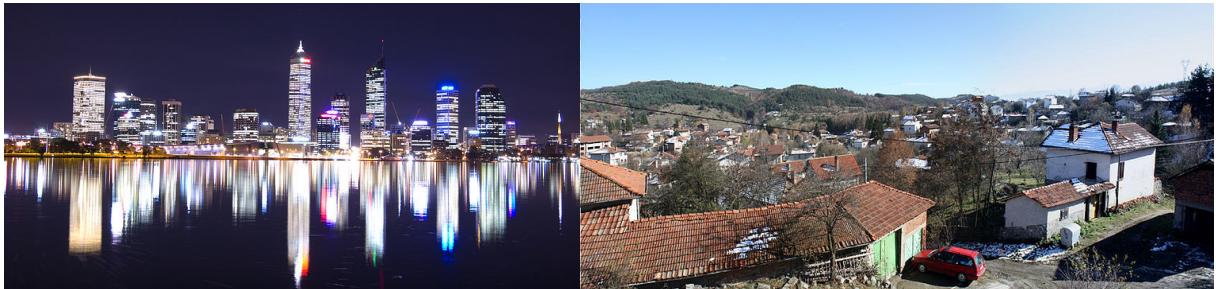

ONLINE APPENDIX

Metropolitan v Small-Town Visualization

For Colombian context, the metropolis could be Bogota or Medellin, and the small town could be Ipiales or Honda.

Figure 3: Imagine a person from a city, say, Chicago or London, meets a person from a town, say, Beeville TX or Vineland, NJ. Some likely face expressions (exaggerated; people hide emotions) of a city dweller are on the left, and of person from a town are on the right.

- (a) city: snazzy, awesome, cool, amazing, sexy, fantastic, spiffy, hot, great, pretty, sharp, stylish, jazzy, nifty, hip, (b) town: boring, ugly, ordinary, dull, average, normal, lame, plain, bland, stupid, common, dumb, unattractive

(c) ecstatic

(d) adored

(e) adoring

(f) embarrassed

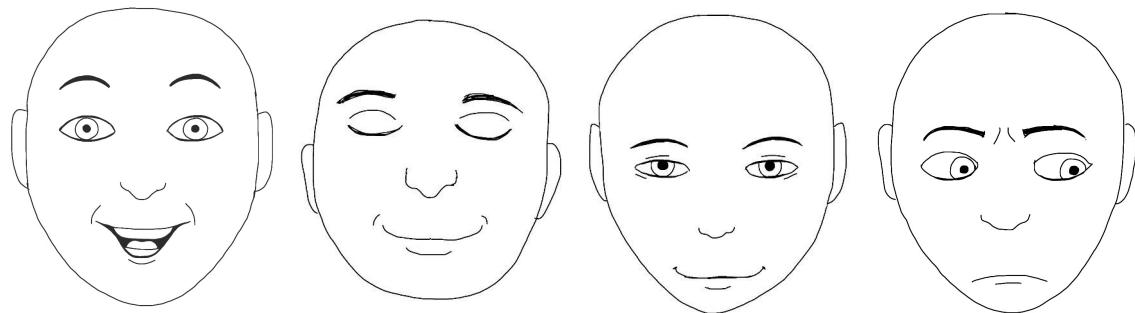

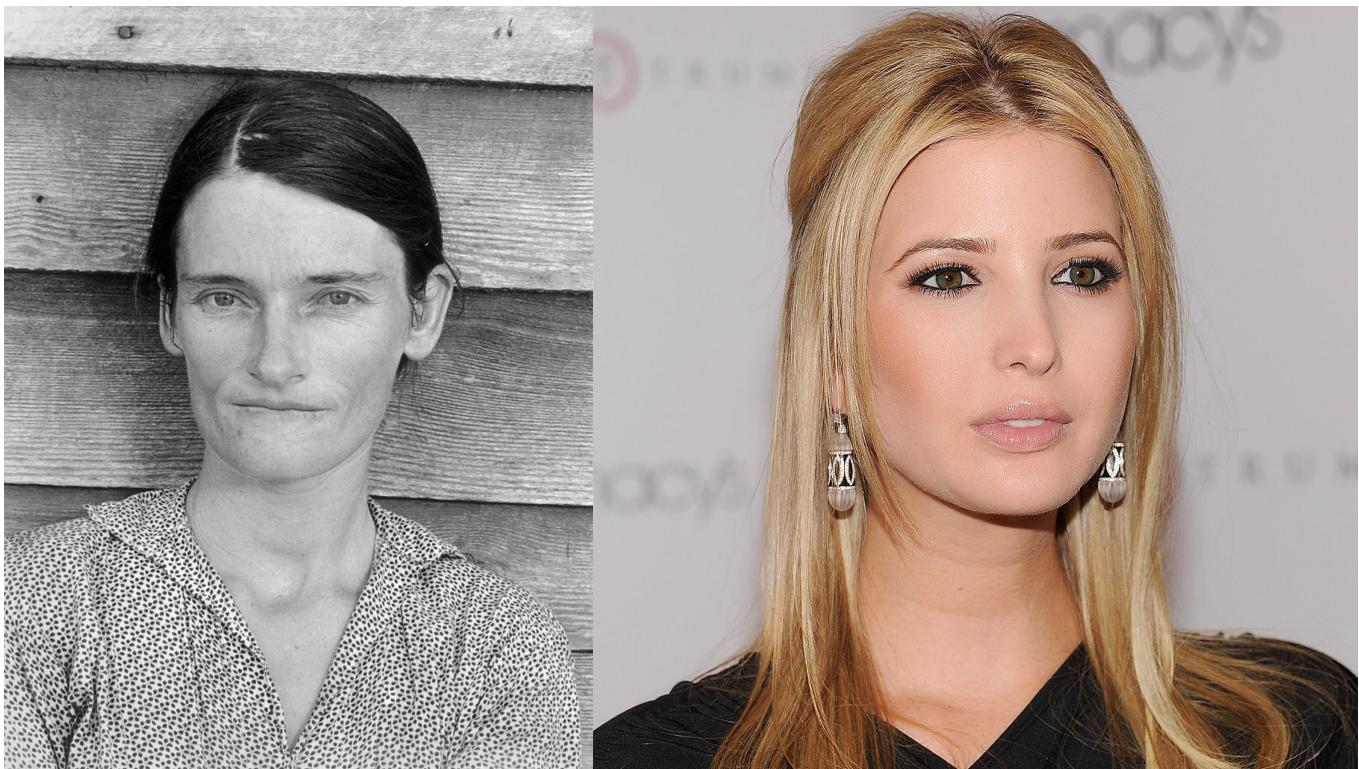

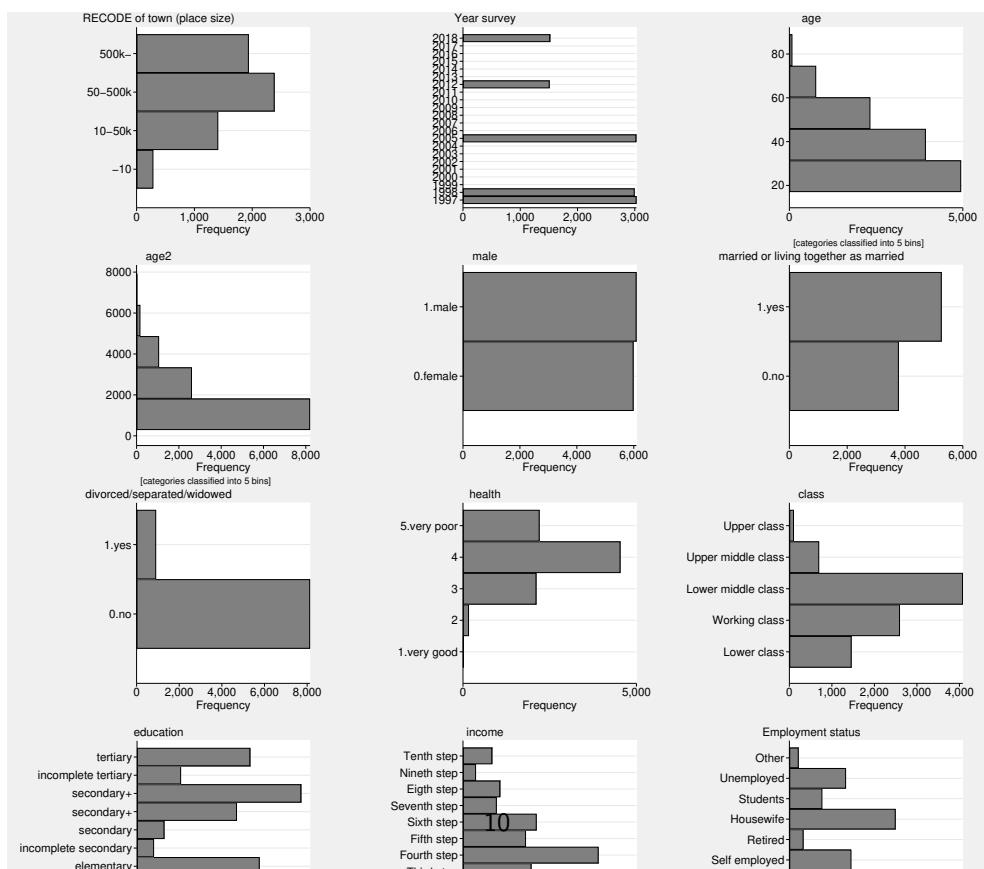

Figure 4: Rural v Urban way of life.

(b) "Charlotte, an urban woman." Ivanka Trump from New York City from https://commons.wikimedia.org/wiki/File:Ivanka_Trump_in_2011.jpg. Creative Commons Attribution-Share Alike 2.0 Generic license.

Variables' definitions, coding, and distributions

Note that the main education variable has a sizeable portion of it missing, and we have filled in the missing values based on the country-specific education variable X025A2, in a following way

```
replace ed=0 if X025A2==0 & ed==.
replace ed=2 if X025A2==1 & ed==.
replace ed=4 if X025A2==2 & ed==.
replace ed=5 if X025A2==3 & ed==.
replace ed=6 if X025A2==4 & ed==.
replace ed=7 if X025A2==5 & ed==.
replace ed=8 if X025A2==6|X025A2==7|X025A2==8 & ed==.
```

The largest Colombian cities were identified in a following way, and the frequencies on them are the following:

```
replace townN=4 if town4==4 & X048WVS==170102
replace townN=5 if town4==4 & X048WVS==170104
replace townN=6 if town4==4 & X048WVS==170129
replace townN=7 if town4==4 & X048WVS==170134
replace townN=8 if town4==4 & X048WVS==170135
//3 more 24 people ONLY:
replace townN=9 if town4==4 & X048WVS==170121
replace townN=10 if town4==4 & X048WVS==170126
replace townN=11 if town4==4 & X048WVS==170128
```

```
cap label drop townN_lbl
label define townN_lbl 1 "-10" 2 "10-50k" 3 "50-500k" 4 "Medellin" 5 "Barranquilla" 6 "Cali" 7 "Bogota" 8 "Cartagena" 9 "Cucuta" 10 "Bucaramanga"
```

tabulation:	Freq.	Numeric	Label

here for last 2 waves 2012 and 2018, more detailed provinces, and larger differences, from 7.6 in La Guajira (only 32 obs) and 7.9 in Cauca to 8.6 in Santander, Caldas and 8.7 in Antioquia, Norte de Santander, and Quindío.

hence the difference between lo and hi is as large as about 1.

after controlling for basic predictors of happiness, relative to base case Antioquia, a number of provinces are less happy, Atlántico at .45, Caquetá at .7, Cauca at .6, Huila and La Guajira at .7, Narino at .6, Valle del Cauca at .5, Cundinamarca at .47, and Bogota (Distrito Capital) at .66. Notably Bogota is the very largest colombian city, and also one of the least happy provinces. and that data from

govt has happiness but not sure how precise is urbanicity: Encuesta Nacional de Calidad de Vida <https://www.datos.gov.co/Estadisticas-Nacionales/Encuesta-Nacional-de-Calidad-de-Vida-ECV-/mz9y-3x9k>

limitation—caveat is that not representative of provinces though pooling 2 years together arguably helps and all regions have at least 40 obs with exception of san andres, choco and la guajira—results for which we refrain from interpreting

TO n org later can redo with latinobarometer, goes back every year to like 95, but at least since 05 has 8 step urbanicity, but top one is 100k and then there is capital ad

and then can do size with province :)

positive relationship with gdp and nil relationship with density right so more developed are denser, thw two correlate at .35, so looking at them simultaneously reveal positive rel with gdp, but negative with density as expected

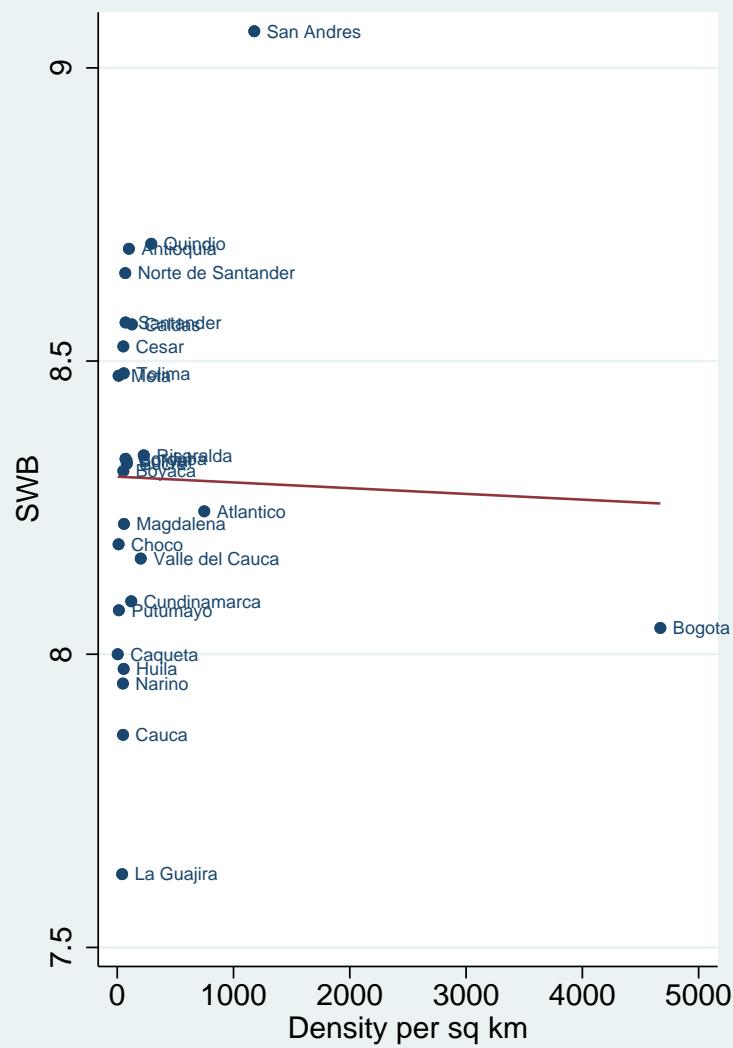

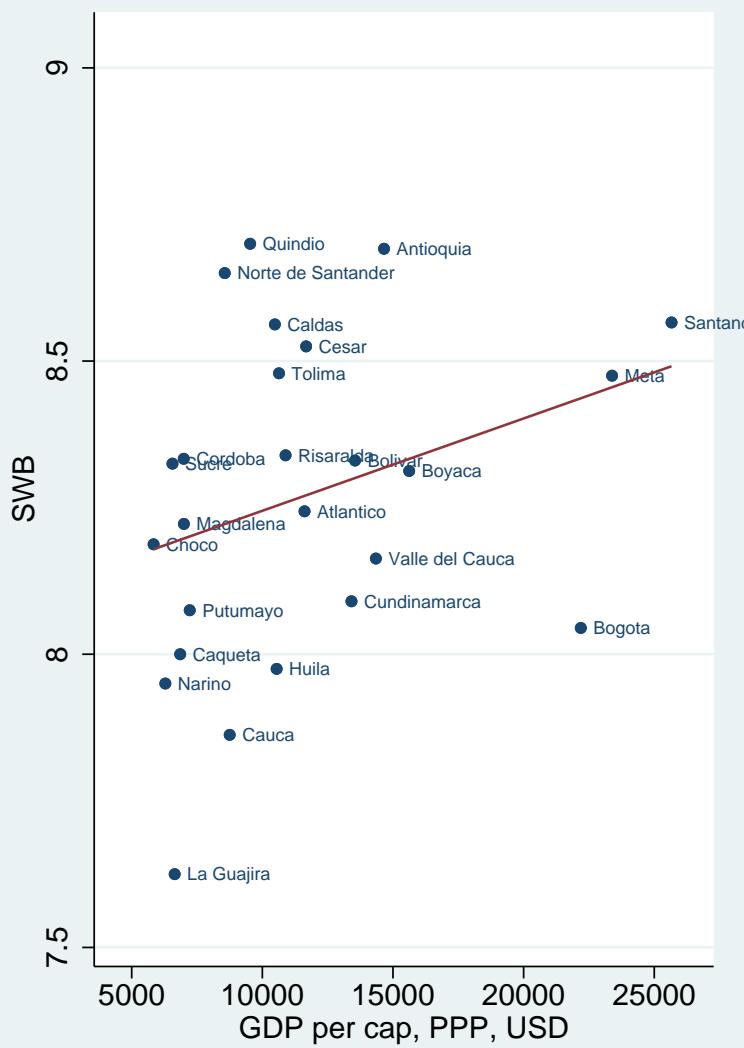

Figure 7: Bivariate relationships

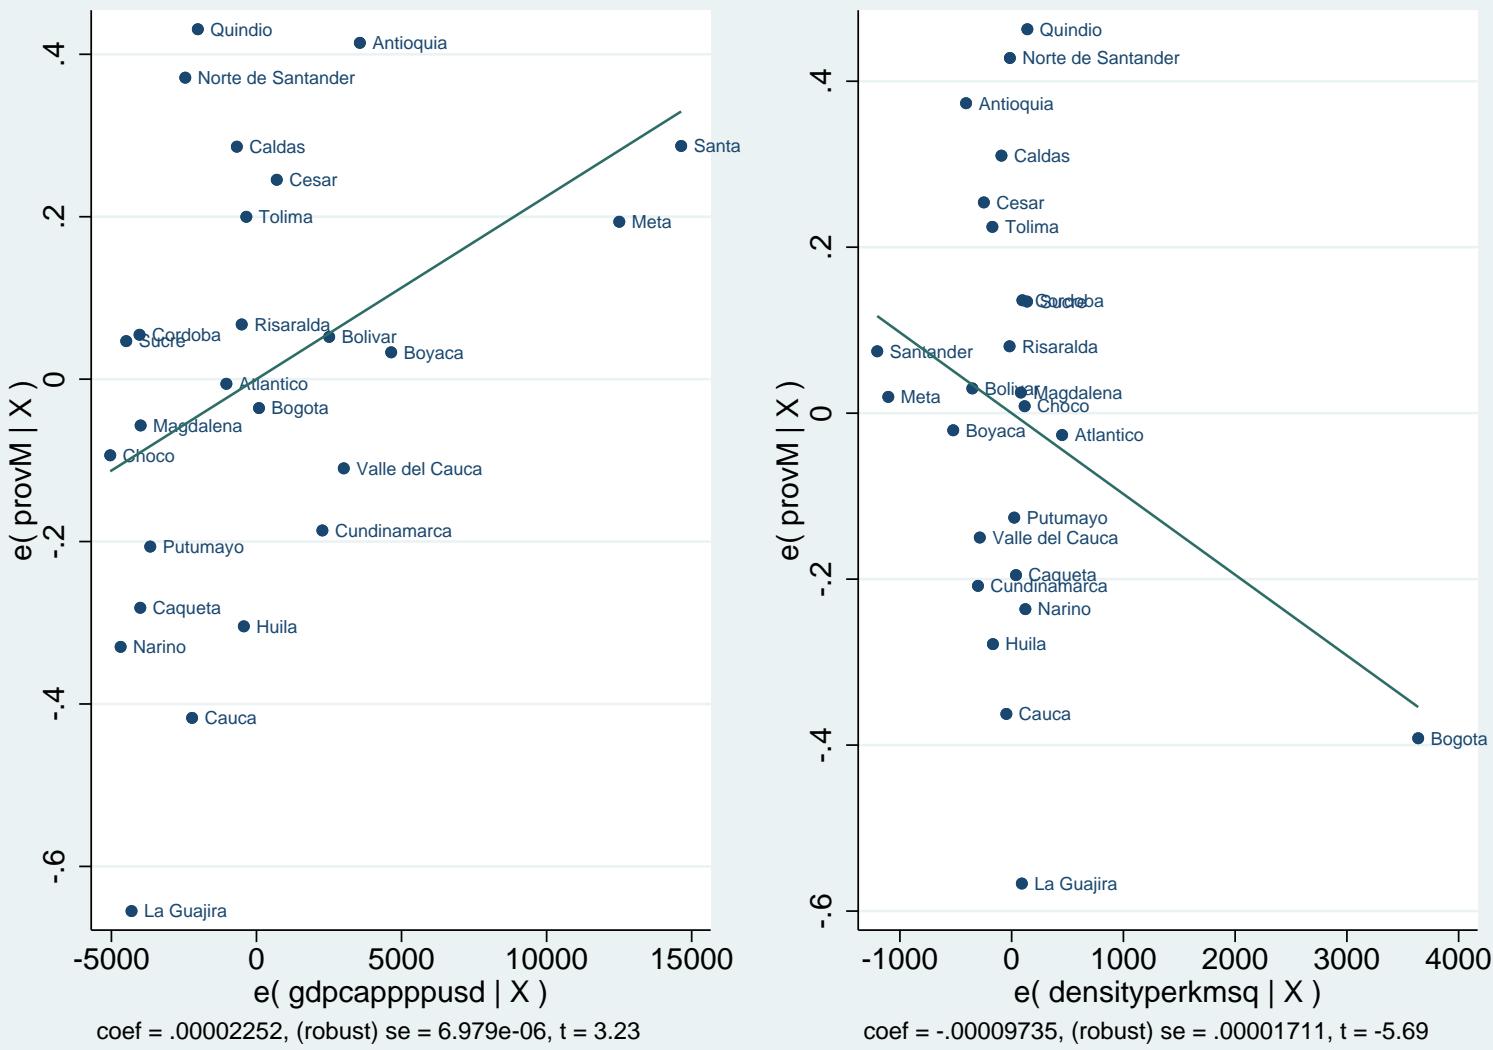

Figure 8: Added Variable Plots relationships

Additional visualizations of the gradient

High Density Living

Contemporary largest cities crowd millions of people at densities of about 25,000/sq km (Manhattan), which is 105 people per acre. Imagine about 3 times larger soccer field (2.7 acre) and 22 people on it (2 teams of 11 players)—it's a livable density—Manhattan has 281 people on it. Of course it is only manageable thanks to towers and underground (subway, tunnels, etc) facilities. And there are dozens of cities more dense than Manhattan, and it is only getting denser and worse.

A city of hundreds of thousands of people is a very recent invention in human evolutionary history—there was no such even single place in the world before around 1,000 BC. By 1850 AD only about 2.3% of world population lived in cities larger than 100,000 (?).

Some argue that many species, e.g., ants and bees, thrive at high densities, but clearly humans are unlike ants or bees. By one estimate—we're 90% chimp and only 10% bee (?). Small population level and density in a natural setting is humans' evolutionary home, not high population size and density in artificial setting (?). Humans have evolved to live sparsely in a natural environment, not

Figure 9: Urban-Rural happiness gradient endpoints. Note that the gradient has multiple steps as illustrated with frownie and smiley emojis, but for simplicity only end points illustrated with photos: very rural v very urban (more photos would make them small and less legible). Images from <https://www.flickr.com/photos/pedrosz/9515685099>, and Bogota Centro International https://commons.wikimedia.org/wiki/File:Bogota_Centro_International.jpg

Figure 10: Urban-Rural happiness gradient endpoints. Images from File:Guican Rural.JPG - Wikimedia Commons, and <https://www.maxpixel.net/Urban-Bogota-Capital-Bogota-Colombia-Architecture-5357148>

(c)

densely in a mixture of concrete, metal, and plastic. Unnatural large population and density is accompanied by a third defining feature of city, heterogeneity or diversity (?). But humans have an ingroup preference or homophily ("love of the same") (??????).

Urbanization Measures From Wikipedia

Quite a growth, in 1950 no city larger than a million, now 5 such cities and notably Bogota close to 10m. All five largest Colombian cities increased more than 5x times since 1950, and even about as much as 10x.

Figure 11: Urban-Rural happiness gradient endpoints. Images from File:Guican Rural.JPG - Wikimedia Commons, and bogota, landscape, bogotá, city, architecture, urban, panoramic, capital, cities, viewpoint <https://www.pxfuel.com/en/free-photo-xiffs>
