# The urban-rural happiness gradient across countrries: city unhappiness is common across the world despite claims to the contrary by economists

Monday 7<sup>th</sup> September, 2020 08:40

This study shows, for the first time, that city unhappiness is common across the World. The finsing is important because there are publications manipulating data through cherry-picking (Glaeser 2011, Glaeser et al. 2016, Burger et al. 2020) and claiming the opposite, that urban areas are happier.

We know that in many countries there is a so called "urban-rural happiness" gradient Berry and Okulicz-Kozaryn (2011), where happiness raises from lowest in largest cities to highest in smallest places. The gradient is non-linear, the very largest cities are markedly less happy than all other areas in a country: New York City (Okulicz-Kozaryn and Mazelis 2016, Senior 2006), London (Office for National Statistics 2011, Chatterji 2013) Helsinki (Morrison 2015), Bucharest (Lenzi and Perucca 2016), Sydney (cited in Morrison 2011). The goal of this paper is to test gradient across countries using one dataset with uniform variables. This study shows, for the first time, that city unhappiness is common across the World <sup>1</sup>

Intersection of quality of life and urban studies is an exciting area. Academics, policymakers, administratos, and common people start to pay more attention to QOL/SWB, not just \$. We finally realize, even some economists do Stiglitz et al. (2009) that money is not everything and time to look at human flourishing and subjective wellbeing or happiness. Although many economists manipulate data through cherry-picking (Glaeser 2011, Glaeser et al. 2016, Burger et al. 2020) and try to claim the opposite, that cities are happier—this is another reason for present study, to provide yet more evidence that economists' claim of city happiness is false.

And the world is experiencing massive urbanizaion-urbanization is arguably the most dramatic change to our way of life Wirth (1938), Hanson (2015), and what arguably matters most is our QOL/SWB. Hence, the question, what cities do to human condition? Modern research on effect of cities on human wellbeing is founded on classic urban sociological research (Tönnies [1887] 2002, Wirth 1938, Simmel 1903, Park 1915, Park et al. [1925] 1984) which argued negative effect of cities on human wellbeing. Quantitative research on the urban-rural happiness gradient dates back to Gurin et al. (1960), Campbell et al. (1976), which also showed negative effect of urbanicity. Yet these were for just the US. Most research is about US, Western Europe, and recently china and handful of other countries. Again, there were studies conducted in separate countries, but not using a uniform dataset across countries with three exceptions discussed later.

First we briefly define SWB and mechanisms that would produce SWB from size of a place.

## 1 SWB

Subjective Wellbeing (SWB) is an umbrella term for various subjective measures of wellbeing, notably positive and negative affects, happiness, and life satisfaction. Most of the SWB research, including this study, uses life satisfaction measure, which is a global self evaluation of one's life as a whole. This measure is mostly cognitive and not affective, respondent evaluates her life as whole globally (everything, including profesional, personal, family, community, etc). The measure captures everything that is going on in one's life—that's a major advantage of SWB measure over other social and economic indicators aiming at measuring human condition, progress, and development. SWB measure is simply the most comprehensive measure possible dwarfing earlier measures such as income, education, or life expectancy. For review see Diener (2009).

<sup>&</sup>lt;sup>1</sup>Yet most research is about US, Western Europe and recently china, and handful of other countries. again, there were studies conducted in separate countries, but not using a uniform dataset across countries. The three apparent exceptions (Berry and Okulicz-Kozaryn 2009, Burger et al. 2020, Easterlin et al. 2010) are not exceptions. No study studies the gradient, all use binary urban-rural operationalizations and present simple mean differences for each country and aggregate results to groups of countries in regressions as elaborated later. Last but not least, Gallup data used by burger and easterlin is problematic; Gallup charges \$30,000 per year for these happiness data (author's email inquiry)–private corporations are making fortune from tax dollars and students tuition–scholars should resist corporatization of academia (Mills 2012a, Cox 2013, Mills 2012b, Catropa and Andrews 2020, SCHMIDLIN 2015), and corporatization of happiness research (Davies 2015).

## 2 urban definition and theoru and causal mechanism/pathway

2

It is useful to start with the theory that would define places and predict how different place sizes would affect swb. Defining mechanisms first helps to define urbanicity. In other words, we present rationality for urbanicity definition with respect to swb. There is a mechanism that would produce different outcomes in swb by urbanicity. Note that this is rather illustratibe than exhaustive and full presentation is beyond the scope of this study.

First, we acknowledge classic urban sociological theory of urban malaise: (Tönnies [1887] 2002, Wirth 1938, Simmel 1903, Park 1915, Park et al. [1925] 1984): cities produce superficiality, transitoriness, withdrawal, impersonality, superficiality, deviance, shallowness, anomie, alienation, and cognitive overload <sup>3</sup>

Sociological theory is not clear at which point urban malaise arises, there is clearly no hard cutoff point, rather the more urban, the more malaise. There may be a certain threshold at which malaise intensifies though.

Another indication of coninuity in effect of size of a place on human condition comes from physics, and clearly points to a continuum. ther is physical city constatnt of 1.15, double size and many phenomena (crime, gdp, income, patents) increase by 15 % Bliss (2014), Bettencourt et al. (2010), Bettencourt and West (2010), Bettencourt et al. (2007).

But we would like to especilly highlight biological/evoutionary mechanism. **TODO merge tehse 2** Throughout most of our evolutionary history, humans have lived in small homogenous groups with low density. As hunters gatherers humans lived in small bands of 50 to 80 people, later on in simple horticultural society in groups of 100 to 150 people, and in more advanced society these groups reached five to six thousand people (Maryanski and Turner 1992). Hence, unlike other species like ants and bees,<sup>4</sup> living in heterogenous, dense, and large settlements (city living) is simply unnatural to human beings.

**TODO** merge tehse 2 For over 95% of our evolutionary history<sup>5</sup> we have lived outside of the cities as hunter-gatherers usually in small bands of 50-80 people (Maryanski and Turner 1992). It only started to slowly change in about 10,000 BC with domestication of animals and agriculture. The first large cities (again, >250k) only started to emerge after 500 BC and there were just handful of them. It wasn't really until after industrialization that large cities started to house noticeable proportion of the population, and only 20th century saw urbanization explosion—in 1800 a mere 1.7% of the world population lived in cities larger than 100k, it slowly increased to 2.3% in 1850, by another 50 years doubled to 5.5% in 1900, and then it doubled again to 13% in 1950 (Davis 1955).

There larger the place, the more built environemnt differes from the habitat in which we have evolved, denser and often crowded loving (cite on crowdedness from city book), airpot, often subwyay or rapid transit, taller buildings in downtowm etc; and again, while clearly a continuum, there is likely to a threshold, perhaps around hundred thousand or more.

There is wilderness, open country, villages, small towns, large towns, cities, large cities, very large cities. Surely, it is rarely captured in its entiterty; but most dataset allow several stages, including wvs used here.

It is a gradient raising from smallest to greatest as argued in Berry and Okulicz-Kozaryn (2009), hence presentation must be ordinal with multiple categories, we have 8 in appendix and can be summarized as smallest v largest; why smallest v largest This study will use 8 categories of urbanicity, and summarize results as 3 categories.

this is the key!!! it is not everything is urban or rural as in easterlin or burger! it is rather very rural, say  $_i10k$  v very big  $_i20k$  couple hundred thousand; stuff in the middle is mixed; it is a gradient! we use two as gradient illustrative extremes not cassifying everything in between! again gradient is non-linear it is very largest cities v everything else, that dichotomy make sense too, but neither this is what easterlin and burger do

# 3 the three studies on urban rural happiness gradient across countries GUESS WRITE THIS AT THE END LOL

The topic of urbanicity and happiness has been recently taken up by economists. "World Happiness Report" (Helliwell et al. 2020) is edited by economists: John Helliwell, Richard Layard, Jeffrey D. Sachs, and Jan Emmanuel De Neve. The report contains chapter about urban-rural gap in happiness (Burger et al. 2020).

"World Happiness Report" is like capitlist manifesto by sachs, an infamous spreader of capitalism in eastern europe THAT BOOK WEDEL BUDDY OF DUMAS, and by corporations GALLUP

There are many "maverick economists" studying "economics of happiness." There are even few serious economists that have truly contributed to social indicators literature, Richard Easterlin and Andrew Oswald among them. Yet, there are skeptics who look down on SWB such as Angus Deaton (e.g., Deaton 2013) and Ed Glaeser (Glaeser et al. 2014, 2016). They are especially troubling: they do some SWB research and at the same time sneer at it. And vast majority of economists simply do not consider SWB, social indicators or for that matter any social science outside of economics as worthwhile (Economist 2016, 2014, Naim 2016, Fourcade et al. 2015).

<sup>&</sup>lt;sup>2</sup>obviously as this is an observtional study, we dont test causality here, nevertheless it is importat to talk about the mechanism

<sup>&</sup>lt;sup>3</sup>and thant no community: but see fischers subcultura theory

<sup>&</sup>lt;sup>4</sup>Human nature is unlike that of bees: by one estimate we're 90% chimp and only 10% bee (Haidt 2012).

<sup>&</sup>lt;sup>5</sup>Per human species evolutionary history, for instance, see encyclopedia Britannica http://www.britannica.com/EBchecked/topic/277071/hunting-and-gathering-culture, For post medieval history see White and White (1977).

In addition to urban-rural gap, there is a chapter "Cities and Happiness: A Global Ranking and Analysis," of course solely by economists, De Neve and Krekel, and citing almost exculsively economists. It starts with an assertion that "cities are economic powerhouses" and that they "they allow for an efficient division of labour" as if that was an advantage when talking about happiness! We know that division of labor results in alienation and unhappiness (Marx [1867] 2010).

no chapter about two key problems, climate change and income inequality, and there is virtually nohing about income inequality, while the chapter on sustainable development, again by two economists, does address climate change. Yet, most of it either treats climate change as some overblown conspiracy:

Alongside social movements such as the "yellow vests" there are the pro-environment movements such as "Extinction Rebellion" that raise alarm bells over climate change

Or finds that sustainability is negatively related with SWB, e.g., "(Responsible consumption and production) and 13 (Climate action) are significantly negatively correlated with human well-being." and that "climate action would also benefit from quantitative reductions in productive capacity that would lead to structural economic changes that would be in tension with other drivers of well-being" but at least they say "Needless to say, however, the urgency of climate change does require action to ensure the well-being of future generations"

Economists' interest in the topic often is often a problem, because biased and flawed research is produced. The problem with economics is bizzare axioms that have little to do with reality, and then often research forces data to agree with these axioms. To economists, the more money (income or consumption), the more utilty, and the more happiness. There is more income and consumption in cities, and hence, economists try to argue that cities must be happier.

Burger study is not only confusing and misguided, but actually deeply misleading and flawed. First it starts with faulty Gallup data<sup>6</sup>:

There are multiple problems with Gallup data. First, it is not meant for research but for commercial use–Gallup charges \$30,000 for access (per one year!). Second, urbanicity classification is twofold less precise than in WVS: 4 v 8 categories. Third, while WVS uses precise population size numeric cutoffs, Gallup uses fuzzy concepts such as "rural area", "small town or village", "large city". Fourth, (and this compunds third problem) Gallup uses self-reports of urbanicity, which is highly subjective and problemtaic in this case—many, if not most people, would likely classify themseves completely arbitarily into "rural area" v "village" and so forth. WVS uses interviewer's information about the place. Fifth, apperntly much of data are missing—easterlin notes that in 14 countries "rural area" responses were exceptionally low. Also, about half or world population is urban, but burger reports that in their dataset only about quarter of respondents report rural residence.

Urbanness or urbanicity is a degree, not dichotomy. Srikingly, burger say that there is a uniform way to measure urbanicity, which is a mere 3 categries: 1) Cities, 2) Towns and semi-dense areas and 3) Rural areas; but they dont even use that in the body of the paper and stick with dichotomy.

The most striking is conclusion: "In line with earlier research, we found that urban populations are, on average, happier than rural populations in that they return higher levels of happiness."—it is actually the opposite—most research finds urban populations to be less happy! It is very similar cherry picking to that in Glaeser (2011), Glaeser et al. (2016) both focus on poor countries or certain specific areas and exceptional cases, without any good rationale for doing so, and then extrapolate it to the world and claim global conclusions.

The earlier other two studies about urban-rural happiness gradient across countries are Easterlin et al. (2010) and Berry and Okulicz-Kozaryn (2009).

Both this study and Berry and Okulicz-Kozaryn (2009) use WVS, Easterlin et al. (2010) and (Burger et al. 2020) use Gallup. Easterlin's paper focuses on effect of economic growth by urban-rural; only a small part of the study is about urban-rural differences in SWB, and their results are much like berry cities paper, which finds that in richer countries people are happier in rural areas.

All three studies so far are limited (and again Burger et al. (2020) presents false conclusion). The present study is the first one to study the urban-rural happiness gradient across countries. First, there is no gradient in none of the above studies—they all use binary (or three category) operationalizations, urban v rural. They also mostly present simple mean differences for each country and aggregate results to groups of countries in regressions. They fail to control for extensive set of necessary controls.

## 4 Data And Model

We use http://www.worldvaluessurvey.org/wvs.jsp, which is representative of multiple countries, and as elaborated in previous section, is much better suited for the study than \$30,000 Gallup data. The sample is listed in table **XXX**. contry coded and descriptive statistics are in SOM. in this study for the models reported in the body of the paper we use XX countries.

SWB question reads "All things considered, how satisfied are you with your life as a whole these days? Using this card on which 1 means you are "completely dissatisfied" and 10 means you are "completely satisfied" where would you put your satisfaction with your life as a whole?"

Urbanicity is operationalized with X049, note that it is objective and recoreder by reviewer, not respondent. There are eight categories ranging from < 2k to > 500k. Because in many countries missing first 2 cat clubbed together...explain in detail **TODO** 

<sup>&</sup>lt;sup>6</sup>easterlin actually did acknowlege some limitations and tried to addres them, but burger seems opposite an advertisement for gallup

elaborate more what exactly used in paper. Again the rationale as per theory above is to explore the gradient, the simplest way to do it is to contrast smallest v medium and largest: this is the key!!! it is not everything is urban or rural as in easterlin or burger! it is rather very rural, say ¡2k or say ¡10k v very big ¿couple hundred thousand; stuff in the middle is mixed; it is a gradient! we use two as gradient illustrative extremes not cassifying everything in between! again gradient is non-linear it is very largest cities v everything else, that dichotomy make sense too, but neither this is what easterlin and burger do The rationale, as per theory is to

Because this aggregation is still somewhat arbitrary, we present alternative **enumerate** specifications in SOM and we also present there full 8-step gradient.

Table 1 lists control variables used in the body of the paper.<sup>7</sup>

Table 1: Variable definitions.

name	description
happiness	"All things considered, how satisfied are you with your life as a whole these days?" 1="dis-
	satisfied" to 10="satisfied"; WVS
place size	"OBSERVATIONS BY THE INTERVIEWER; Code size of town where interview was con-
•	ducted"
education	"Highest educational level attained"
income	"Scale of incomes"
class	"Social class (subjective)"
health	"State of health (subjective)"
postmaterialist	"Post materialist index "
god important	"How important is God in your life? Please use this scale to indicate- 10 means very important
	and 1 means not at all important."
religion important	"WVS2000: For each of the following aspects, indicate how important it is in your life.
	Would you say it is: EVS1999: Please say, for each of the following, how important it is in
	your life. Religion"
autonomy	"Autonomy index"
freedom	"Some people feel they have completely free choice and control over their lives, while other
	people feel that what they do has no real effect on what happens to them. Please use this
	scale where 1 means 'none at all' and 10 means 'a great deal' to indicate how much freedom
	of choice and control you feel you have over the way your life turns out."
trust	"Most people can be trusted"
LI UJL	wood people can be trusted

In choice of controls we generally follow (Okulicz-Kozaryn and Valente 2020). There are specific controls worth discussing.

Young, single and childless persons and young men with tertiary education are relatively more satisfied with urban areas as place of residence (Carlsen and Leknes 2019). Income, class, and education are important controls–not only predict greater swb, but also confounded and higher in cities.<sup>8</sup>

One great advantage of city living that is often forgotten is freedom "City air makes men free (Stadt Luft macht frei)" Park et al. ([1925] 1984, p. 12)<sup>9</sup>, hence we control for freedom.

Likewise, trust is important, it predicts swb, and it is lower in cities (Milgram 1970).

Health is a key predictor of swb, and also note that subjective health measure used here is a reasonable measure of actual health (Subramanian et al. 2009).

We use a standard OLS regression with robust standard errors. We treat the 10-step happiness variable as continuous. Ordinal happiness can be treated as a continuous variable (Ferrer-i-Carbonell and Frijters 2004). OLS has become the default method in happiness research (Blanchflower and Oswald 2011). Theoretically, while there is still debate about the cardinality of SWB, there are strong arguments to treat it as a cardinal variable (Ng 1996, 1997).

## 5 Results

While, again, we do concern ourselves with the coninuum, the urban-rural happiness gradient, results are in the SOM, here for ease of exposition, we only preent the contrast between smallest, medium, and largest places. ¿¿¿ There is a considerable tradeoff in this study between ease of presentation and elaboration as there are dozens of countries and presenting different specifications would result in unwieldy presentation—additional specification are in SOM. Here we just present one model that is full including all necessary and some additional controls (yet not over staurated where too many variables result in too many missing obs), also the mdel presented here uses just 3 categores, -5 (base), 5-500, and 500-; we are interested in comparison between -5 v 500- because this is aaccording to theory: evolution/ingroup v most unnatural (as this data allows).

## TODO have couple paragraphs interepting these regressions

<sup>&</sup>lt;sup>7</sup>There are models with additional controls in SOM (Supplementray Online Material).

<sup>&</sup>lt;sup>8</sup>where i dicuss controls in data and to literature where i slam burger and indeed as shown later comparing unadjusted means results in cities being happier notably due to confounding of higher income education and class–see appendix for tables with and wohou controls

<sup>&</sup>lt;sup>9</sup>It originated in the Middle Ages, and it meant freedom from feudalism, non-feudal islands in a sea of feudalism (Harvey 2012).

**Table 3:** exT3-3

 $5/25 \colon 80$  perc less happy! mostly easyern post soviet copy from below lol  $^{10}$ 

Results in table ?? are remarkable. In most countries large cities are less happy than small settlements. Remarkably, without exception, in no developed country city is happier than smallest areas. The only four countries where people ar ehappier in large cities are:

and the point is that the only ones that are sig and positive are wiers small poor and most miserable countries except india which is a big puzzle

**TODO repreat it multiple times! TODO add NOR NLD** so the conclusion is that in all develped countries AUS, CAN, DEU, ESP, ITA, NZL, SWE, USA, cities are less happy <sup>11</sup> in vast majority of countries effect in ngeative, only positive in these 4: russia, moldova and albania are all post soviet countries, they are likely to still be very centralized where power opportunity and resources are located in large cities; india is clearly an outlier here and we dont have a good explanation [blind for peer review]

make the biggest swb gaps by country key focus of paper :) **TODO!!!** this research focus on specifics countries esp where urb rural grading is greatest!

yah i think just one table! refer though to bivairate in appendix and say this in footnote and or app Table ?? shows

<sup>&</sup>lt;sup>10</sup>note result for VEN should be interpreted with caution this is the main difference with table ?? and probably has to do with the fact that there are only 60 obs on the base case category. Other results are similar between the two tables.

<sup>&</sup>lt;sup>11</sup>at least in less elaborate specs, but even in most elaborate even if insig, still neg

resuls of regression of swb on place size dummies (controlling for year dummies), which essentially differences in means for each size category. Results are mixed, but large cities (500k-) and even medium sized (100-500k) are often happier than the smallest category (the base case or reference category, -2k). Usually differences are small to moderate, about .5 (on 1-10 swb scale), but sometimes large, larger than 1. Do mention the extremes and think about why-but we do not have explanation for those.

This is what the literature reports, tht results are mixed, in some cases cities are happier, in some cases they are not. A key finding of this study is that once we properly control for key predictors of swb, almost uniformly large cities (500k-) are less happy than the smallest settlements (-2k). Results are shown in table ??.

## 6 Discussion ANd COnclusion

it is not city probelms but city itsef—my paper with jonie the mechanism is important how and why would urbnnnes affect human wellbeing?

; while again we would like to have more gradation at the top of the distruibution, but 500k is a reasonable and adequate cutoff to disinguish a large city from other places. there are no other data better suited for this purpose and we do best we can. And results are conservative—had we have cutoff at 750k or 1m they'd be stronger MY BOOK AND CITIES WHEN CITY IS TOOO BIG.

limitations: Have in paper caveat about cross cultural comparability, see shourjya paper lol

Many countries where no difference—this is still striking and worth reporting and city triumph—one would think cities are the best places to live, people flock there in doves Show graph from UN, and the common narrative is that city is the place to be, and so one would think people are happier there. So finding of no difference is already surprising.

Do visualize results, say a even a small country of 10m and even a miniscule effect of .1 on scale from 1-10 that translates to an effect equivalent to making100k people from most miserable to most happy on swb scale 1-10 if everyone lived in smallest v largest. Small or moderate effect sizes translate into large effects because of the sheets size of urbanization in billions of people.

that graph from inglehart, in developing countries, and as per maslow pyramid, at first one need to focus on necessities such as survival and cities do help; it is remarkable that in all developed countries studied here, cities are less happy!

Why in developed world people are less happy in large cities, but in many developing countries they are happier? There are at least two reasons. In many developing countries life is simply unberable outside of the city lacking necessities such as shelter, foot, water, sanitation, and healthcare. In developed countries, even smallest places have reasonable access to necessities, and they do not suffer from urban disamenities. Also, it may be so that the grass is always greener on the other side—people idealize what is missing or what is rare.

An alarming trend in higher education, and in research in general is corporatization of higher education and research (Mills 2012a, Cox 2013, Mills 2012b, Catropa and Andrews 2020, SCHMIDLIN 2015). This includes happiness research (Davies 2015). "World Happiness Report" (Helliwell et al. 2020) and its chapter about urban-rural gap in happiness (Burger et al. 2020) uses data from a private corporation. Indeed, the report, and its presentation (e.g., that new zealand happiness conference) is largely an advertisement for Gallup. Gallup then sells the happiness data at \$30,000 (per year!)<sup>12</sup>—arguably this is not meant for research (most researchers cannot afford it). The goal here appears not to produce knowledge, but to make money—after all the sole responsibility of a business is profit (Friedman 1970).

# 7 Takaayway for Practice

Humans are worse off in cities (in terms of happiness). But not always what makes us happy is the right thing to do COMPASS PLEASURE ARISTOTLE. Notably, climate change is more important than human happiness, and cities are most environmentally frindly type of settlemt (MEYER). and there are some limited things that can be done to make cities less miserable—we know what makes city happy BALLAS.

perhaps the cleaest takeaway for practice is that we suffer from overpopulation; again, we need cities becuase of climate change (not of production DEGROWTH KALIS), but we would need cities less if we had fewer people—contraception, sterilization etc; once there are fewer people, then we can have a meaningful discussion about right city size—cp from book; it is remarkable that there is no discussion about it! how could we have gone so wrong to think that the bigger the better and that there is no limit—cities are balooning—tokyo has about 40m people, and there are many 20m cities; Ancient athens were 140k and rome was 450k

Table 7: Icount

# 9 descriptive stats

like in eb paper maybe also like min and max and everything in app but order somehow anyway but yeah can see diff in mean across categories from bivariate but still median and sd by cat would be useful!

#### 9.1 Limitations

We do not use Gallup data. Some may argue it is a limitation becuase these data cover more countries than WVS. However, apparently Gallup data cost tens of thousands of dollars and we cannot afford it. In fact we'd discourage scientists from paying from tax money to private corporations to do research. Therefore we actually consider it our advantage not to use Gallup data.

Many world countries are missing, using more WVS data in the future as they become available.

right there are limitations, many countries dropped out as they dont habe many people in smallest or biggest areas

Cross cultural comparbility is a caveat, we run separate for each country and ont pool data but still, it should be kept in mind that happiness can mean soemtig different in different countries. likewise world cities are very different, bradth of the study is accomanied by oversimplification.

"There is research in this area which claims that urban-rural differentials might be country-specific and not be generalisable at all (Rees, Tonon, Mikkelsen, & Rodriguez de la Vega, 2017)."

## 9.2 Urbanicity Definition and results by different definition and sequentail elaboration

we have 3 different operationalizatios of urbanicity: original 8 cat, collapse one way and collapse the other way; and 3 sets of models: bivariate (iwth yr dummies), esentially mean diff betwenn cat; basic set of controls; necessary/important ones; full//extened (one in the body); and there is 4th one over saturated but has most missing obs and hence postponed to the next section.

where i dicuss controls in data and to literature where i slam burger and indeed as shown later comparing unadjusted means results in cities being happier notably due to confounding of higher income education and class

**Table 27:** exT3-4

so i think start with exT4-2 clean and easy and simple; then exT-3 to show detail and robustness

**TODO** meh yeah i guess drop this first table!!! note that all developed countres are less happy in cities, AUS (insiginifacnt but sig in next table (todocheck!)

p<0.1; robust std err Table 29: exT4-2 OLS regressions of swb on place size, controls (not shown) are: enumerate

in atble ?? several appear happier like BGD, IND, LTU, PAK, ROU, and RUS, when adding more controls and full town cat that disappers except for 4 ctrioes

Results in table ?? are remarkable. In most countries large cities are less happy than small settlements. Remarkably, without exception, in no developed country city is happier than smallest areas. The only four countries where people ar ehappier in large cities are:

Table 31: exT-3; note robustness chech results are in SOM.

and tehre is even one more elaborate model #4 in app with satfin and crime like about **todo count lol** 20/70 neg of all and nly 4/18 of sig are pos about 80 perc are neg :) or 5/21 in exT4-3

and the point is that the only ones that are sig and positive are wiers small poor and most miserable countries except india which is a big puzzle

**TODO repreat it multiple times! TODO add NOR NLD** so the conclusion is that in all develped countries AUS, CAN, DEU, ESP, ITA, NZL, SWE, USA, cities are less happy <sup>13</sup> in vast majority of countries effect in ngeative, only positive in these 4: russia, moldova and albania are all post soviet countries, they are likely to still be very centralized where power opportunity and resources are located in large cities; india is clearly an outlier here and we dont have a good explanation **[blind for peer review]** 

The limitation of X049 is not only a low top bin for largest cities (500k+), but also about a thrird of values missing. Future research can focus on specific countries using other data or WVS data using X049CS variable, which has country specific sizes of places, which

<sup>&</sup>lt;sup>13</sup>at least in less elaborate specs, but even in most elaborate even if insig, still neg

however are not directly or easily comparable—bins differ across countries and in some cases place is names "major city", "Farm / Mountain / Fishing village," etc).

show distributuion of place size by country!

## 9.2.1 original 8 categories

#### 9.2.2 0-5k v 500k+

yeah this is following berry, but better have 0-5 so that more obs lol

## 9.3 Crime and Cost of Living/financial satisfaction

missing obs but here as a robustness check

TO WHERE I HAVE WE NEED TO CONTROL FOR CRIME: Urban unhappiness is not only due to urban problems such as crime and poverty. Cities themselves, their core defining characteristics, size and density, are related to unhappiness (Okulicz-Kozaryn and Mazelis 2016).

yeh so one limitation is lack of crime; so bias on results cities wiuld be happier otherwhise

**Table 41**: ex1

## 10.1 very first results

Table ?? shows resuls of regression of swb on place size dummies (controlling for year dummies), which essentially differences in means for each size category. Results are mixed, but large cities (500k-) and even medium sized (100-500k) are often happier than the

smallest category (the base case or reference category, -2k). Usually differences are small to moderate, about .5 (on 1-10 swb scale), but sometimes large, larger than 1. Do mention the extremes and think about why—but we do not have explanation for those.

This is what the literature reports, tht results are mixed, in some cases cities are happier, in some cases they are not. A key finding of this study is that once we properly control for key predictors of swb, almost uniformly large cities (500k-) are less happy than the smallest settlements (-2k). Results are shown in table ??.

Results in table ?? are remarkable. In most countries large cities are less happy than small settlements. Remarkably, in no developed country city is happier than smallest areas (with exception of KWT and SAU-these are middle eastern and oil rich, where cities are glorious indeed)—and they are not developed countries according to IMF or UN anyway neither have very high HDI.
