Continue to the second second

a dillema: publishabe project or student project [NOT resMet] respond to comments on final project draft [qm*,dev]

links: a good piece of research in words of other people [NOT resMet]
the end of theory: data is enough; and airplane model [datMa

regression [qm2]
data managemnt [datMan]

start early

- oit's high time now you know what you'll do for the final project
- ♦ if you are not sure, email me
- ♦ if you cannot find data, email me
- ⋄I'd like to meet with each of you at least twice per your project

kill 2 birds with one stone

- ♦ analyze something that you study for another class
- ouse data from your work
- · no matter where you work—they always have some data

start with good data

- ♦ representative
- onovel/innovative (eg twitter)
- ♦ local/familiar (so that you can compare to your experience)
- olong term investment (use same data for years)

treat it seriously, dont't waste your time

- onot only a big chunk of the final grade
- ♦ use it or lose it!
- ♦ if you don't use tools, you will lose this skill soon
- be efficient, use this class for something beyond this class
- · do something useful for your work (civic engagement)
- · it could be analysis chapter for your capstone/thesis/dissertation/journal paper
- •important!: email me drafts and see me few times in the second half of this class

the good news

- the good news is that you already have much of it
- just reuse your problem sets
- ⋄yes, you can reuse past (future) assignments for final project
- ⋄or you can, of course, come up with something new
- you can also reuse your work from other classes/projects
 (eg your job)
- but in that case you need to clearly state what you are reusing
- state that in the text of the final project, eg at the beginning of it

the bad news

- there is always bad news accompanying good news...
- ♦ if you are building on your past ps
- you need to extend them very substantially
- ·cannot just glue them all together
- oand they need to form a logical project
- oit needs to be interesting/innovative
- and discuss your findings—why they are important?
- owhat is new there?

consensus creation or consensus shift

- perhaps your study creates consensus or shifts it
- ♦ great if it does

<u>outline</u>

outline

final paper/project in general [NOT resMet]

a dillema: publishabe project or student project [NOT resMet] respond to comments on final project draft [gm*,dev]

interesting to you- >fun for you

- study something that is of interest to you
- ♦ say crime if you live in high-crime area
- or agriculture if you live in high-agriculture area
- ⋄eg I study income inequality, because my family is unequal
- ♦ fun to work on something of great interest to you

be curious

- ♦ curiosity is arguably the most important reason for research
- ♦ do research about something that you are curious about
- ♦ it will be fun and you will be good at it

interesting to others ◊(if interesting to you, more likely also interesting to others) ·(if you hate your work, others won't love it)

- ⋄ research must be interesting⋄ i am very much against typical dry research only
- demonstarting technical proficiency or mastery of material research should read like a story
- ·its language should be simple
- · do not write words that you do not use when talking
- "person", not "individual"

be simple and clear:

"explain", not "elucidate"

the "so what" question?

- ♦go through your final project and ask yourself "so what?"
- ♦ if what you have just read is not relevant, drop it
- ♦ this rule, as all rules here, pertain not only to text
- but also to tables, graphs, maps, etc

quality vs quantity

- ♦ do not just dump everything that you know on the topic
- ♦ in fact, the opposite is good:
- · be as brief as possible
- vi will decrease grade for padding: (putting irrelevant/wordy stuff into your paper)
- sure, do a lot of stats, reading, mapping
- · but give me only the best of it
 - but give me only the best of it
- · (have to do a lot to find the best)

data managemnt [datMa GIS (todo)

like a peer-review process

- ♦i will give you comments on your draft
- ⋄you need to respond to *all* comments
- you may disagree but you have to respond

inline response

- you need to reply inline, ie quote my comment and then respond to it
- ofor example see my https://sites.google.com/site/
 adamokuliczkozaryn/gis_int/rev_ariq.pdf
 oif no tracked changes be specific where the change was
- · unless there is a huge difference between the draft and final paper—then can refrain from specifying page and paragraph (but again ideally your final draft should be aas close as possible to the final paper!

made-page and paragraph

outline

links: a good piece of research in words of other people [NOT resMet]

i wish i knew it when i was a student

- instead of rephrasing what i have learned by reading other people description of good academic work
- ⋄i am just linking their writings
- following their advice should help you producing a good
 final project for this class
- ♦ we'll quickly scan through them
- ♦i also list some points in slides
- ⋄read them after the class—they are very useful

Greg Mankiw

- "My rules of thumb"
- http://scholar.harvard.edu/files/mankiw/files/my_rules_
 of_thumb.pdf
- have productive mentor(s)
- Scott Long's research shows that a student's productivity depends on mentor's productivity
 have broad interests, be interdisciplinary
- your research should be T-shaped: broad, but also deep in
- your research should be I-shaped: broad, but a one area

Greg Mankiw

- http://scholar.harvard.edu/files/mankiw/files/my_rules_
 of_thumb.pdf
- time management is key! extremely easy to mismanage time in research:
- \cdot ask yourself how what you are doing now gets you to your goal
- · have strategy
- write well—see other slides; essp: simple, clean

Andrew Gelman

- "Advice on writing research articles"
- ♦ http://andrewgelman.com/2009/07/30/advice_on_writi
- be clear about your story
- give your paper to other people to read
- ♦ ask for comments

- start with the conclusions and work back to abstract

Gary King [do it at home]

- "Publication Publication" and some notes under:
- ♦ http://gking.harvard.edu/papers
- oif needed, criticize others, but step on their shoulders, not their face
- ♦ [note: this is about replication; still some good ideas]

great references on academic writing

- clarity, simplicity, conciseness
- ♦http://amzn.com/0060891548
- ♦ http://amzn.com/1577660633

<u>outline</u>

how do i produce a final project for this class?

final paper/project in general [NOT resMet]

a dillema: publishabe project or student project [NOT resMet] respond to comments on final project draft [qm*,dev]

links: a good piece of research in words of other people [NOT resMet] the end of theory: data is enough; and airplane model [datMan]

regression [qm2]
data managemnt [datMan

the end of theory: data is enough; and airplane model [datMan]

wired article

- http://archive.wired.com/science/discoveries/magazine/
 16-07/pb_theory
- ♦ again, we have data revolution
- ounprecedented amounts of data about pretty much anything
- without being too serious about theory!
- onote: this is computer science approach to data analysis
- ♦ such view is not mainstream in social science

theory

- ♦ there is no reason to be very serious about existing theory
- theories are only valid untill proved wrong
- ⋄remember "all models are false, some are useful"
- our model and theory is *never* right
- · world is too complicated

we need new theories

- · we just want to show some useful pattern
- ·that's all we can do
- ·still, we want to be as close to the truth as possible

airplane model

- models replicate some of the useful features of real objects
- think of an airplane model
- there are airplanes models without windows
- ♦ and models that are too heavy to ever fly
- yet they are useful eg to test airflow in a wind tunnel

but these models are not the same as airplanes

- (and nobody claims they are "true")
- ♦(and nobody claims they are "true")
- ♦ but social scientists behave as if they have "true" models
- ♦ your regression model is always false, but hopefully useful

build new theories and models...

- because all theories and models are wrong, be creative
- ocome up with new theories in models
- odon't take well established theories and models for granted just because they are out there for a long time and everybody uses them

- your new theory/model may already be old
- · (reinventing the wheel)
- \cdot rather invent the new given the old-build on other's work
- ⋄you have to defend your theory/model
 ⋅why is it important ? "so what ?"
- how come millions of other soc sci did not get?
- why they got it wrong?
- ♦ again, all models/theories are wrong, some are useful
 ♦ also, some are better than others in terms of
- /creativeness/logic/argument/robustness
 the end of theory: data is enough; and airplane model [datMan]

conclusion: theory and modeling

- ♦ think out of the box
- ♦ be creative
- do not use models only because everybody else uses them
- defened your approach

and remember that no model works all the time

- ⋄eg famous now professor couldn't get into PhD
- ♦ because his GPA was low,
- and model prodicted that people with low GPA cannot do well in PhD
- model works probably well most of the time, but as any
 model
- ♦ it sometimes fails

<u>outline</u>

now do i produce a final project for this class?

final paper/project in general [NOT resMet]

a dillema: publishabe project or student project [NOT resMet] respond to comments on final project draft [gm*,dev]

links: a good piece of research in word resMet]

the end of theory: data is enough; and airplane model [dat regression [qm2]

dio (todo)

onow you know the basic and powerful tool of multiple OLS owhat next ?

ouse it !
oturn your ideas into new theories and hypotheses

what next?

your main X, controling for other X's

♦ do data support your hunch ? find out ...

♦ be creative! being social scientist you don't have to study

♦ and test those hypothses by regressing the outcome (Y) on

economic development or income inequality

you can study happiness, culture, religion, terrorism,
facebook relationships, and so forth

theory, logic, explanation

 again, you need to have some theory that makes sense and that is interesting for public policy/business/philosophers, etc...

· and be as clear and simple as possible

eg "Wage is a function of education and experience; it is based more on merit than on privilege, such as race and gender." [see also Alesina's paper in few slides]

♦ do not say that you expect that "gender affect wage" etc...
• why ? how ? so what ?

regressions

- · again, do not overemphasize Rsq
- ·do *not* pick the models based on the Rsq!
- · use beta coeff to compare magnitude!
- see code in 1.4 Multiple Regression

https:

//stats.idre.ucla.edu/stata/webbooks/reg/chapter1/

regressionwith-statachapter-1-simple-and-multiple-regres

regression [qm2] 41/71

regressions

This is great! The coeff on exp is < .1 depending on specification; with .1 it means that 10 more years of experience (a lot!) would produce only 1 more \$ per hour

regressions

- oproduce alternative models, eg merit v privilige
- but then always have a combined model with both to see which one is more important
- is privilege affecting wages controlling for merit?
- is merit affecting wages controlling for privilege?
- oif both merit and privilege affect wages
- · (they do—we know it from theory and models)
 then if you run separate models, you have LOVB!

regression [qm2] 43/71

general coding practices

- clean data and save it as something else (never overwrite the original files)
- ♦ cleanup, save, and then for analysis start with clean:
- have a final clean combined data file that you will use from
- ♦ then descriptive statistics

merge/append

now on

- ♦ and inferential statistics
- ♦ NOTE: in the course of coding code chunks will be all over the place — rearrange them

file formats again

- ♦ again, no Microsoft files
- ♦ stata code—can append at the end of paper
- ·can post online
- ·can have a separate .do file
- ·but never have a dofile with a non .do extension
- · (unless it is an appendix in your paper)

dropping outliers

- ♦ if dropping outliers, always say why
- $\diamond\,\text{and}\,$ may have an analysis including them in the appendix
- ·if not sure... (unless it is obvious that outliers must be dropped)
- however, rarely anything is obvious in research
- · best try different options/do robustness checks...
- yet, there is obviously a time constraint

make it meaningful

- ⋄eg better have freq or perc for histogram
- avoid ugly graphs and tables: follow published examples!
- ⋄don't forget about the practical significance!

elaboration of the model

- ♦ start with a basic model
- possibly bivariate and have more columns adding more covariates as per
- theory the idea is that you test competing hypotheses/alternative
- and in doing so show the robustness of your results

explanations

do the whole thing

- why study only counties in South Jersey
- or only libraries in Philly
- when you can study all of them!
- ♦ and at very least compare with your small n results

speculation/opinion

- ♦ this is not an op-ed
- there cannot be any speculation/opinion
- all statements must be supported by evidence
- evidence: literature or your own results

this is soc sci, not data sci

- oin social science all models must be theory driven
- ·(this is not true in statistics or data science)
- choice of variables, functional form (e.g. log) must be theory-driven
- ⋄you need to be explicit why you run a model that you run !

satisfy assumptions

- ⋄you *always* have to take care of assumptions
- ⋄e.g. heteroskedascity etc
- ♦ don't have to discuss in great detail in paper
- obut have to have code—you need to show that you have
 done it!
- ⋄if you have many obs, no need to worry about normality
 ⋄also do not spend too much time on violations; just need to take care of them in dofile!

yet, another note on collinearity

again collinearity is just a correlation between independent vars

⋄you can see it with corr

 \diamond some people say that you have collinarity if say correlation > .9

⋄you really have collinearity most of the time
⋄you can also use vif

yet another note on BLUE

- what BLUE really means?
- how estimators compare ?
- lets compare efficient/inefficient and unbiased/biased estimators
- · draw a picture (based on Kennedy)

organize

- descriptive stats goes before the regressions, not after
 (unless in the appendix)
- oif descriptive stats is not very interesting (e.g. table of means and sd) just put it into the appendix
- oinstead of having alternative models, elaborate models
- ⋄ figures and tables need captions and numbering
 ⋄ captions need to be very detailed so that you can
 - understand table/figure from the caption only
- → axes need to be labeled in the figure→ have to refer tables/figures in text
 - , -

contribute

- ⋄don't be modest!
- your paper needs to contribute to the literature
- t should be clear how it contributes
- ♦ again, explain:
- · how come nobody else did this before
- ·or/and how come they got it wrong

get intuition; make it meaningful

- ♦use beta coefficients
- use more descriptive statistics

cite data; replication replication

- ♦ data you should clearly cite data
- $\cdot\,\text{best}$ give URL and authors and description
- · describe sample, time, sampling, etc
- ♦ your dofile should produce final results from the raw data
- · do not just send me the dofile with few regress
- \cdot it should have all the commands you executed after loading the fresh data

.

interpret!

- beginning researchers usually do not spend enough time on interpreting the results
- there should be at least 1 page (12pt, double-spaced) of discussion
- ·what have you found
- · substantive meaning
- ·why does it matter
- 1. /6 .
- ·limitations/future research

· "so what?"

ols almost always useful; sometimes not best

- what data you have ?
- ols is good for cross sectional data only
- oif you have panel or time series or dyadic/network data you need different models!
- · in this class it is fine, again ols will often give you reasonable results
- · but you should at least acknowledge the problems

paper

♦ let's have a look at Alesina's "Public Goods and Ethnic

Divisions"

http://www.google.com/search?sourceid=chrome&ie=UTF-8&
q=public+goods+and+ethnic+divisions

- · nice elaboration/sequential models, eg TABLE III
- · well-developed theory-alternative explanations
- · multiple models
- · sensitivity analysis

another example

- CassPortfolioPaper-FinancialLiteracy.pdf

 oskip nonlinear logit models!
- ♦ by a former student in this class
- onote that it tells a story, it is interesting, engaging
- ♦it contributes—we learn something new

theory first, descriptive statistics second

- ♦ then regressions, interpretation and discussion
- ♦ last but not least, this paper looks polished and

"publishable"

more examples

- ♦ https://link.springer.com/article/10.1007/s11205-011-9812-y
- ♦ https://link.springer.com/article/10.1007/s12232-015-0223-2
- ♦ http://journals.sagepub.com/doi/abs/10.1177/0042098016645470
- ogo through at least some of them and do ask questions if anything unclear
- OMQE is mostly about interpreting regressions!

regression qm2 63/71

practice interpretation

- ♦ http://link.springer.com/article/10.1007/ s11482-014-9319-1
- what is worse for wellbeing: inequality or poverty? ♦ Tab1: note precise definitions of vars
- ♦ Tab2: some examples: be meaningful! ♦ Fig1, 2: des sta

♦ Discussion: gini ranges 32 to 60, if goes up by

- ♦ Tab3.4: coef, and std coef
 - 6*.5=.3*100k (in avg county): 30k unhealthy days
- · causality: alternative explanations, reverse causality

practice interpretation

http://link.springer.com/article/10.1007/
s11205-016-1327-0

\$11205-016-1327-0 \$70s v 00s: 50% wider happiness gap: middle class v rich

♦ Tab2: interactions

⋄Fig1, Table 1: des sta

⇒Fig2: Ŷ

⋄robustness checks: eg Fig6, Fig10

outline

a dillema: publishabe project or student project [NOT resMet]

respond to comments on final project draft [gm*,dev]

data managemnt [datMan]

data managemnt [datMan]

do something useful

- odo not just merge, loop, reshape, etc
- · for the sake of doing it
- · eg first split dataset, and then merge it back again
- playing is fine for learning and exploration
- but the final project must do something useful!

one-on-one

- ♦ again, let's work more one-on-one in second part of the class
- the idea is that by the end of the semester you will
- · develop a great dataset
- · understand your data really well (des stats, graphics)
- · and be able to change/expand your data easily
- \cdot also be able to manage output (tables, coeff, graphs) easily

how do i cite data

- the most proper way
- http://www.bu.edu/datamanagement/background/cite/
- http://libguides.lib.msu.edu/citedata
- https://www.icpsr.umich.edu/icpsrweb/ICPSR/curation/citations.jsp
- the quick way way: just give url
- you can also then load it directly into stata
- ·but keep it on hardrive as well!
- ·data on websites change and disappear

<u>outline</u>
