why bother? and intuition

computing probability

conditional probability and independence

psl, psl-1 3/

your own research

- how is it going?
- again, get data asap and start looking at it
- o "get your hands dirty with data"!
- don't wait-it takes time to get the data
- AND you may design some great framework, only to find there are no data
- you may still do it for capstone; but again need your own data asap
- o it may only be related to your major dream project
- o but it would still help a lot to get you closer

ps2 comments fa2021

- always do pay attention to results, be critical, does it make sense?
- apparently scatterplots in excel came out wrong for many folks, eg camden is 70 and 0, not 70 and 4!
- #2 is about proportions or percents; not really about mean, median, mode; correlation is fine, yet just 3 data points so not super useful

general ps2 comments 6/3

ps2

- always show your work, eg formula for mean, and plugin numbers
- always interpret, say you calculated corr as -.95, do say it is very strong and so strongly supports the hypothesis that...
- same with scatterplot and everything you calculate, always interpret!!
- for compliments/complains the key of course is to calculate proportions or percentages; interpretations could be quite different
- remember that corr is not causation!

general ps2 comments 7/33

ps2

- few of you confused pos with neg correlation!
- as a custom put independent/explanatory variable (counseling) on X axis; and outcome or explained (dropout) on Y
- do not connect lines on scatterplot! if anything software must fit the line that goes kind of in the middle (it is NOT simple line connecting points)
- always label all axes in graphs

probability

why bother? and intuition

computing probability

conditional probability and independence

probability 9/3

what is it?

- the numerical measure of the likelihood that the event will occur (the proportion of times the outcome would occur)
- it ranges from 0 to 1
- 0 means impossible
- o never 0, almost nothing is impossible eg $\frac{1 (crashes)}{10m (flights)}$
- 1 means certain
- o also almost never 1; almost nothing is certain
- probability is really the basis of all statistics

probability 10/33

probability

why bother? and intuition

computing probability

conditional probability and independence

making right decisions

- people and orgs make mistakes bc miscalculate prob
- o eg gambling and lotteries
- smoking (hundreds or thousands of % increased risks!)
- flying v driving, etc
- 9/11 killed additional thousands
 because people chose to drive (Wheelan, 2013, p.72-3)
- think about probabilities when making a decision
- the easiest (but already informative and helpful):
- $\circ \frac{\mathit{occurences}}{\mathit{total}}; \mathit{eg} : \frac{\mathit{cancers}}{\mathit{smokers}}; \frac{\mathit{crashes}}{\mathit{miles}}; \frac{\mathit{crashes}}{\mathit{hours travelled}}$

o so depends how you measure! car v flight: hours v miles!

why bother? and intuition 12/33

why is prob relevant to MPA student?

- probability may be confusing!
- but probability improves thinking/decision making
- o it is everywhere!
- usually don't realize it, but we calculate prob all the time!
- o and it helps our lives enormously if can do it better!
- how likely that this will be on exam—should i study it?
- how likely i will get caught if i am speeding?
- how likely a student will drop out?
- how likely that graduation rate is above some value?

why bother? and intuition 13/33

important for organizations!

- eg identify teachers who cheat or doctors who overcharge
- (just identify outliers, and unlikely events (nontypical))
- (or overall changes/trends (for everyone) that are suspect (collusion?))
- public policy makers determining dangerous items
 eg swimming pools kill more kids than guns
- (just see how many there are and how many people die from them!—simple des stat)
- for more interesting examples see Levit's Freakonomics http://www.freakonomics.com/

why bother? and intuition 14/33

evolutionary and counterintuitive!

- evolution made us to survive in an environment that is long time gone!
- \circ so is our cognitive function and probability calculation off!
- and so we need statistics to help us think better!
- eg: overestimate prob of memorable/flashy events
- terrorist attack and airplane crash are similar to mistaking stick for snake etc-better be extra careful and see even if it's not there
- we underestimate, on the other hand
- much more deadly effects of sugar and fat (which were always rare and desirable)

why bother? and intuition 15/33

i used to have a policy about undocumented

emergencies

- and i do not have it anymore! thank god for probability!
- there were 7 students and 4 of them had their grandmas die
- the reported probability was too high to be plausible!
- so what's the prob of grandma dying during this semester?
- say avg grandma is expected to last at least (if not more) about 10 years, or 40 three-month periods in a year (about semester long)
- \circ so about 1/40, so for 10 students class: every 4 semesters one grandma dead

why bother? and intuition 16/33

probability

why bother? and intuition

computing probability

conditional probability and independence

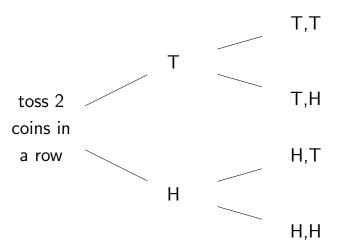

computing probability 17/33

concepts

- ullet event (A), (B), etc: a set of outcomes, eg $A = \{T, T\}$
- sample space (S): the finest grain, mutually exclusive, collectively exhaustive listing of all possible outcomes
- mutually exclusive (disjoint):
- \circ 2 outcomes can't occur at the same time, eg T and H
- collectively exhaustive:
- \circ 1 outcome must occur: eg eg T or H
- eg toss a coin twice
- $S = \{H, H\}, \{H, T\}, \{T, H\}, \{T, T\}$
- $A = \{T, T\}$

computing probability 18/33

tree

computing probability

table

- 1st row H in first flip
- 2nd row T in first flip
- 1st column H in second flip
- 2nd column T in second flip

computing probability 20/33

exercises...

- what is the probability of getting 2 T in 2 flips ?
- we just showed with tree and table that there are 4 possible events, and only one outcome with 2 T, so $P=\frac{1}{4}$
- how about at least 1 T?
- $P = \frac{3}{4}$
- how about exactly 1 T?
- $P = \frac{2}{4}$

computing probability 21/3

some useful properties and useful language

- intersection (and) \cap (both have to happen)
- \circ multiply prob (=< 1), so less likely to have both (frownie)
- union (or) ∪ (at least one has to happen)
 add prob. so more likely to have both (smiley)
- add prob, so more likely to have both (smiley)
- eg A = H B = H
 A ∩ B = {H, H}
- $\circ A \cup B = \{H, H\}, \{H, T\}, \{T, H\}$
- if mutually exclusive: $P(A \cup B) = P(A) + P(B)$
- if mutually exclusive and collectively exhaustive: P(A) + P(B) = 1
- \circ eg A = tail B = head; <math>A = male B = female

cards examples

- $P(heart) = \frac{1}{4}$
- mutually exclusive

$$P(A \cup B) = P(A) + P(B)$$

- $P(ace \ or \ king) = P(ace) + P(king) = \frac{1}{13} + \frac{1}{13} = 2/13$
- not mutually exclusive

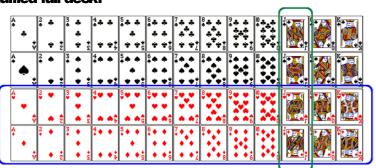

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

- \circ P(ace or black) = P(ace) + P(black) -
 - $P(ace \ and \ black) = \frac{4}{52} + \frac{26}{52} \frac{2}{52} = 7/13$
- P(heart|red) = 1/2 because sample space is reduced to 26 red cards (will get back to it at the end!)

computing probability

Union of non-disjoint events

What is the probability of drawing a jack or a red card from a well shuffled full deck?

$$P(jack \ or \ red) = P(jack) + P(red) - P(jack \ and \ red)$$

= $\frac{4}{52} + \frac{26}{52} - \frac{2}{52} = \frac{28}{52}$

What is the probability that a randomly sampled student thinks marijuana should be legalized <u>or</u> they agree with their parents' political views?

	Share		
Legalize MJ	No	Yes	Total
No	11	40	51
Yes	36	78	114
Total	47	118	165

- (a) (40 + 36 78) / 165
- (b) (114 + 118 78) / 165
- (c) 78 / 165
- (d) 78 / 188

comp.(e)pr113il/y47

Product rule for independent events

 $P(A \text{ and } B) = P(A) \times P(B)$

Or more generally, $P(A1 \text{ and } ... \text{ and } Ak) = P(A1) \times ... \times P(Ak)$

You toss a coin twice, what is the probability of getting two tails in a row?

P(T on the first toss) \times P(T on the second toss) = $(1/2) \times (1/2) = 1/4$

computing probability 26/33

A recent Gallup poll suggests that 25.5% of Texans do not have health insurance as of June 2012. Assuming that the uninsured rate stayed constant, what is the probability that two randomly selected Texans are

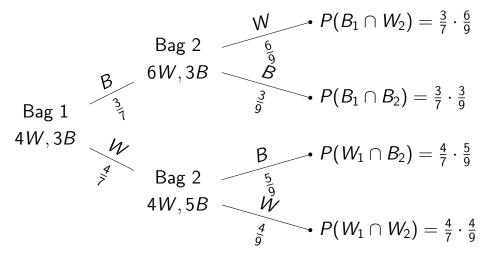

both uninsured?

- (a) 25.5²
- (b) 0.255²
- (c) 0.255×2
- (d) $(1 0.255)^2$

computing probability 27/33

tree example

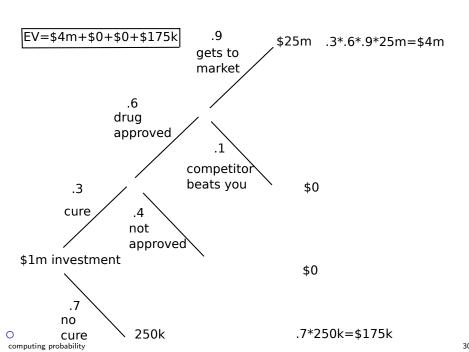

http://www.onemathematicalcat.org/Math/Algebra_II_obj/prob_tree_diagrams.htm

computing probability 28/33

Expected Value (Wheelan, 2013, p83)

- just multiply value (\$ amount) by associated probability(ies) AND add them up
- o and this is how much you are expected to get on average

computing probability 29/33

30/33

outline

```
general ps2 comment

probability

why bother? and intuition

computing probability

conditional probability and independence

conditional probability

- $P(A|B) = \frac{P(A \cap B)}{P(B)}$
- you have $P(A \cap B)$ in numerator because both A and (\cap) B need to happen to be conditional on B, if A happens but not B, then it cannot be conditional on B

table practice (all numbers in the body are "∩")

Type of Policy (%)

Category	Fire	Auto	Other	Total %
Fraudulent	6	1	3	10
Nonfraudulent	14	29	47	90
$P(fire) = \frac{20}{100}$	$= .2^{0}$	30	50	100

- $\circ P(F|fire)$ is 6/20 or .06/.2
- P(fire|F) is .06/.1

strategy

- yes, probability can be confusing...but
- probability is not a rocket science
- if you think about it you can figure it out
- formulas may be more confusing than revealing
- you can just use tables or possibly best to use trees...
- i don't care what method you use
- we'll practice more next week!

WHEELAN, C. (2013): Naked statistics: stripping the dread from the data, WW Norton & Company.
