MMQGIS

QuickMapServices: OSM and others

qgis2web

workflow/saving and customizing

get the plugins

- plugins-manage and install plugins
- you can enable there lots of stuff–scroll down, there's some self-explanatory options
- experiment at home! many great tools there

outline

python plugins

MMQGIS

QuickMapServices: OSM and others

qgis2web

workflow/saving and customizing

the power

- arguably the most useful and comprehensive plugin of all
- we will use it a lot in this class; especially:
- MMQGIS-Combine-Attributes Join from CSV layer
- MMQGIS-Combine-Geocode CSV with Google / OpenStreetMap

outline

bringing basemap

- esp if you map at low level (neighb, city, county)
  - you want some background (roads, parks etc)
    (eg as in google maps)
- you could do it step-by-step
  - find roads layer, parks layer, etc
  - lots of work !
- you can very easily bring all of that with a basemap

QuickMapServices plugin

- Plugins-Manage And Install Plugins
- and search for "QuickMapServices" and install it
- Web-QuickMapServices-OSM-OSM Standard
- and it appears on the left under layers
- move it as the last layer so that it does not cover your map
- and nj_counties-Layers-Properties: Fill, Simple Fill: Fill style: "No brush" so that the polygons have no fill
- again especially useful at low level: neighb, street, etc

Stamen

- QuickMapServices-Settings-More Services-Get contributed pack

- and really really nice are Stamen maps, say:

○ Terrain

○ Toner

OSM:OpenTopoMap

- as per satelite-like basemap layer which shows land use, i'd recommend OSM:OpenTopoMap
- it helps say when you want to figure out what is going on in specific area

others

- there are many
- names mostly selfexplanatory
- go through them and play around
- you can present on this and get extra credit!

python plugins

MMQGIS

QuickMapServices: OSM and others

qgis2web

workflow/saving and customizing

qgis2web

- install it; will appear under web, like openlayers

- Apperance:Add layers list: Expanded

- Export: Export folder change to where you can write

- Have Stamen Toner underneath :)

- https://www.qgistutorials.com/en/docs/web_mapping_with_qgis2web.html

- https://www.xyht.com/spatial-itgis/creating-a-web-map-using-qgis2web/

- https://www.sigterritoires.fr/index.php/en/
  how-to-export-your-qgis-project-to-an-html-page-in-two-clicks-the-qgis2web-pl

- howto share this? zoom screenshare ! :)

- zip and email to people and ask them to unzip and open
  index.html with webbrowser

  ○ or see references–you can webhost that :)

outline

workflow

- save the whole project (with many layers) and next time just open it

○ (again, dont rename, move shapefiles around–it'd break things)

- can move layer up/down in layer window

○ and can turn it on and off

- can have many layers with say different symbology of the same shapefile

- example–let's load nj_counties and produce several different symbologies and save whole project...and open it

customizing

- one way to customize is to instal py plugins
- but you can also customize the presence and placement of the core tools
- you'll use qgis a lot–make it comfortable
- can customize what is displayed–right click at the top (below MENU)
- and select the stuff you want to have displayed
- can grab a toolbar (left side) and move around

misbehaving software

- most of the software sometimes misbehaves...
- it does silly things, refuses to do something, crashes, etc
- troubleshooting:
- email me
- do what you are doing in a different way-e.g try different dataset; different var; different approach etc (usually can do same thing in many ways)
- shut it down and fire it up again
- reinstall
