geo-processing

Extra/bonus

example: apts close to episcopal church in Philly

example: hwys in NJ

geocoding: address→(lat,lon)

◇ say that we have some addresses and we want to geocode them

◇ https:
//sites.google.com/site/adamokuliczkozaryn/
gis_int/apartments-for-rent.xls

◇ open, looks reasonably clean, save as csv

MMQGIS-Geocode

· MMQGIS-Geocode-Geocode CSV with Google/OpenStreetMap

◇ it works better if you specify more information

◇ make sure Address Field, City Field, State Field are right

· make sure notfound.csv is saved where you want

◇ pick OSM, let's hit ok, it takes like 50sec

◇ https://mangomap.com/blog/
  how-to-make-a-web-map-from-a-list-of-addresses-in-a-spreadsheet/

.

◇ btw, if already got X/Y lat/lon:
  just add your csv with "Add Delimited Text Layer" tool

important to check!

◇ see notfound.csv: mostly those with a range of street numbers (if you geocode everything)

◇ need to fix them/adjust them:

· to check can just google them and see if you get a clean hit

◇ check location on OpenLayers

· does it make sense? houses in river or park?

· zoom-in to street, click some points with "identify tool": pop-up address–does it match with the street?

· usually some miscodings, say few percent

· usually because the address is misspelled or incomplete

geocoding

SQL

spatial join

>probably finish first part here>

geo-processing

Extra/bonus

example: apts close to episcopal church in Philly

example: hwys in NJ

SQL: Structured Query Language

◇ full blown (not in qgis) SQL is only little more complicated

· very much English-like, just with some strict syntax rules

◇ also a job market skill: put 'basic SQL' on your linkedIN next to 'gis' skill

· very easy to master in no time

◇ https://www.youtube.com/watch?v=afPL7-QfHr4

◇ https://www.youtube.com/watch?v=jJeae7PJVv4

advanced filter (expression): SQL

◇ nj_counties-Open Attribute Table

◇ bottom left box-"Advanced Filter (Expression)"

· Fields and Values "REGION"

· and on the right Load values: "all unique"

· then we can type

◇ "REGION" = 'CENTRAL' and hit OK

· now easy to modify at the bottom of table, say:

◇ "REGION" = 'CENTRAL' OR "REGION" = 'SOUTHERN'

◇ "REGION" = 'CENTRAL' AND "POP2010" > 598349

regular expressions

$\diamond$ can also match part of a string:

$\diamond$ regexp_match("COUNTY",'C.*N')

$\diamond$ regexp_match("COUNTY",'^C.*N') must start with 'C'

$\diamond$ regexp_match("COUNTY",'^C.*N$') and end with 'N'

$\diamond$ then can hit ctrl-a to select all data

· right click layer, save as (check "selection")

saving selection often necessary

$\diamond$ keep in mind simplicity principle!

· drop all unnecessary clutter

· do not map things that you don't care about

outline

geocoding

SQL

spatial join

>probably finish first part here>

geo-processing

Extra/bonus

example: apts close to episcopal church in Philly

example: hwys in NJ

doing it commonsensically

◇ you can actually spatial join with regular join we've covered

◇ the idea is that you have non-matching geographical levels

◇ say hospitals in excel and zip-codes in shapefile,

◇ you want to map sum of patients in hospitals per zipcode

◇ you can do it in qgis (next slides)

◇ but you can do it by hand:

· use stata, excel, sas, spss, etc

· just add patients within each zipcode and

· merge zipcode patient sums with gis file at zipcode level

a proper spatial merge

◇ as above: things do not fit geographically...

· say zip codes in one data, and counties in another data

◇ can map both and merge based on <u>location</u>

◇ so called "spatial join"

· have to pick: mean, sum, or first

join counties with universities

◇ nj_counties

https://docs.google.com/uc?id=1xJDhcRCkgv7k4tNCa72Oog5bohV6dTB2&export=download

◇ and universities

https://sites.google.com/site/adamokuliczkozaryn/gis_int/hsip_colleges.zip?
attredirects=0&d=1

◇ and first make ENROLL numeric: text-to-float

thinking

◇ as always, think what your are doing and what does it mean

· and double check

◇ here there are some institutions with 0 enrollment

· they were missing ("") before the text-to-float

· ideally, you should find out what these enrollments are: eg call the institution

droping cases

$\diamond$ universities-Open Attribute Table

$\diamond$ bottom left box-"Advanced Filter (Expression)"

$\cdot$ "ENROLL" >0

$\diamond$ then in table without zeros, Ctrl-a to select all

$\diamond$ layer-Save as, ('Save only selected features')

MMQGIS-Combine-Spatial Join

◇ Output: nj counties

◇ Spatial Operator: Contains

◇ Data (Join) Layer: universities

◇ Attribute Operation: Sum

◇ Fields: COUNTY AND ENROLL

◇ double check: say Atlantic has 2 and sum of 13,880

◇ use identify tool: 7035+6845=13,880

◇ click on ENROLL col header to sort and we see that

· Essex County wins with COUNT of 9 and ENROLL of 65k

◇ now could do graduated map of ENROLL for counties

more about spatial join

◇ matching census tracts with towns http://trendct.org/2015/05/29/

this is a whole bag of tools

◇ we switch gears a little and discuss

· more advanced topics beyond mapping

· more like typical GIS/IT stuff

◇ we will just cover few tools

◇ there are dozens of them

◇ you may present some of those for extra credit

· let me know– some may not be useful for this class

◇ those that i think are especially useful are covered below

◇ most are under 'Vector', and also 'Plugins'

dissolve

◇ dissolve into a larger area

· (get rid of inside boundaries)

◇ Vector-Geopocessing Tools-Dissolve

· nj_counties

◇ "dissolve field:" region

dissolve your way

◇ can dissolve into your own categories/definitions

◇ let's take regions and dissolve into south and north jersey

◇ Open attribute table-toggle editing-New column-integer:
  'southNorth'

· sort on REGION and mark southern regions with 1, and the
  rest with 0

· may also highlight the row to see which county is where

◇ Vector-Geopocessing tools-Dissolve

◇ "Dissolve field:" southNorth

◇ often you will have to do something like this

◇ no way to find a shapefile for South Jersey online!

simplify polygons

◇ remember from principles: simplify as much as possible

◇ simplifying polygons means dropping vertexes, so that
  polygons are defined by fewer coordinates draw

◇ it reduces size of a file

◇ Vector-Geometry tools-Simplify Geometries

· Input: 'nj_counties'

◇ can play with "tolerance" to achieve desired simplicity

· try 1000–see the difference?

· also, you can simplify lines (fewer nodes)

◇ and i guess you can also simplify points (fewer dec points)

· reference http://gis.stackexchange.com/questions/25914/
  how-to-smooth-generalize-a-polygon-in-qgis

centroids

◇ calculate a center of a polygon or turn polygon into a point

· useful when merging non-overlapping polygons–say congressional districts and counties

· then you can calculate centroid of one of those and merge with polygons of the other layer if a centroid is in that polygon using spatial merge

◇ draw a picture

◇ Vector-Geometry tools-Polygon centroids

· Input: nj_counties

centroids

⋄ note: the new shapefile will have the same data

⋄ can now map another variable and overlay on another
  variable

⋄ can map both points and polygons with some symbology

⋄ let's map population for polygons

· and population density for points

· note: make points bigger to see symbology well

⋄ this solves the problem of showing 2 vars in one map

buffering

◇ kind of opposite of centroids:

· make a buffer (circle) around a point

◇ say, need a 'dry zone' around schools

◇ load $2007\_11\_30\_NJ\_COLL\_UNIV\_{NJSP}$

◇ Vector-Geoprocessing tools-Buffer

◇ use 20,000 feet (buffer size is in map units)

◇ save as 'colBuf'

◇ Properties-Metadata or even -General

· unit is us feet

◇ note: buffer is a new layer and then can spatially merge it with another layer

example: environmental problems around univ

◇ download and add to qgis

- `http://www.nj.gov/dep/gis/digidownload/zips/statewide/`
  `Envr_mon_gw_KCSL.zip`

◇ Vector-Data Management Tools-Join Attributes By Location

◇ Target: colBuf

◇ Join: Envr_mon_gw_KCSL

◇ Take summary of intersecting features

- say 'mean'; but we only care about counts, which is automatic

◇ Keep all records

do here 'select by location tool !'

investigate

◇ open attr table of merged shapefile

◇ go to last column 'COUNT' and click 2x to sort descending

◇ under 'NAME' we find that 'NEW JERSEY MEDICAL
  SCHOOL'

· has biggest problem! over thousand contaminated sites

◇ select say 3 rows at top

◇ click at the top 'zoom map to selected features'

· a lot of overlap there

◇ but from the table can select schools with greatest problems

· and take some measures to help with the situation

buffering: applications

◇ why would you do buffering?

◇ sex offenders and schools

◇ liquor stores and schools

◇ waste processing plants and houses

◇ 2-mile heavy pollution around hwy

◇ walkability to healthy stores, etc

◇ many applications!

nj roads

◇ say we want to find out which county has the longest interstate hwy network

◇ http://www.state.nj.us/transportation/gis/data.shtm

◇ and get

◇ NJ Roadway Network

◇ http://www.state.nj.us/transportation/gis/zip/NJ_Roads_shp.zip

◇ SQL ROUTE_SUBT=1 (interstate hwys)

◇ and save selection as hwy.shp

◇ VECTOR-ANALYSIS TOOLS-SUM LINE LENGTH

· Input polygon: 'nj_counties'

· Input line vector: 'hwy'

◇ and the winner is... Morris county

TODO: update to 2.x
