outline

intuition

general idea, intuition

- data management is mostly about:
- manipulate eg gen, map, [:]—today!
- and understand/des sta/vis
 - eg describe, value_counts—last week
- and merge—next week
- pretty easy—no complicated code, no fancy things
 - but also lame, boring, and tedious
 - yet necessary!

basic coding rules

- simplicity/clarity: drop the clutter, be clean
 - drop everything not necessary
- efficiency: have “tight” code:
 - as few lines as possible that do as much as possible
- be lazy/work smart not hard, eg do only whats necessary
 - eg only ren the key vars
 - copy from others and use AI, not $>90\%$!
- transparency/readability (meaningful names: df, var; etc)
- more rules later
