1 sep2 going back to first regressions

now noticing i have dropped earlier all vars with income, not doing that; and interesting stuff: effect of agency almost as large as that of income!! and about half of social class (same coeff; but class 1-5 and agency 1-10)

*EMAIL: adam.okulicz.kozaryn@gmail.com

I thank XXX. All mistakes are mine.

2 feb21 [post-meet] some more results

2.0.1 quick/lose ideas and comments on pptz and doex in goog drive; some todos and maybe paper idea

GovRespAutonomy.pptx

P1 on liberated side add humanists and Frankfurt school:
Maslow, Fromm, Marcuse

And it's also urban v rural eg simmel metropolis and mental life, toennies gemeinachaf/gessellschaft

And Marx's alienation:
<https://theaok.github.io/docs/colQolSwb.pdf>
"3.3 Theory of Alienation"

P6 'The autonomous individual' love the slide great points reminds me of Michael slides with agency definitions

S7 bright side--could add Eudaimonia perhaps; self actualization maybe; and maybe maybe (as you also cite toqueville) it could also relate to protestant work ethic, higher gdp, creativity innovation (Richard Florida) etc

S8 dark side; "the autonomous asshole" musk, thiel, trump, narcissistic with little empathy, pride with little shame and guilt, not humble

And Fromm escape from freedom: freedom can be difficult, it's burden in sense it strips security and traditional social bonds

And actually modernity while it liberates say v feudalism, it also oppresses:
Freud civilization and it's discontents: modern/western civilization suppresses humanity

The social cage by Alexandra Maryanski:
Humans have natural preference for autonomy, freedom, and choice, and yet we are trapped in the "cages" of rigid social structures--yes especially agrarian and horticultural societies, but also now (v hunter gatherers)

And somewhat related res by p k piff--successful ones attribute success to themselves not the society; monopoly experiment

!!PAPER IDEA!!
P9 Research Questions
'Is rising autonomy accompanied by a decline or rise in preference for government responsibility?'
This implies time but we mostly have cross sections in wvs, can do waves, and maybe relate freedom from(negative, freedom house, Fraser index, etc) to freedom to (positive, our WVS item)--are societies that went up on first freedom also up on second?so a panel version of my
https://theaok.github.io/docs/free_from_to.pdf

P12. Data and Measures
Important to add health: both predicts + autonomy and probably - govRes; so critical to control as per SIR editorial Bartram argues to control for predictors of main IV! And need literature about what predicts autonomy and redistribution (alesina wrote a lot)

S14 Country-level correlations and trends
Trend is great but should do by ctry, and I'd add negative freedom and focus on cases where there was big increase. Cross country is great but need to reformulate q1 to cross sec, not time-series

S15, Country-level changes
Id flip dv with IV
And again maybe add neg freedom. And could lag to tease direction. Eg neg freedom as ecological framework can drive personal preferences for redistribution (govRes), but also personal preferences can drive societal framework. There are theories to support both, I have a student doing dissertation on abortion preferences and abortion policy can ask her for opinion/preferences-policy theories

P17Individual-level associations
Id treat autonomy as categorical not continuous as I was getting in my regressions, just dummy categories out
And we need effect sizes, are these big? Say as important as income or health etc?

P18 country by country
Love this! Yes I was finding BRA positive too, have to ask my Brazilian collaborator Rubia valente about this. Second positive is POL need to think about it. One thing about POL (and other eastern Europe) is that it changed a lot from social collectivist laid back to capitalistic stressed etc so would be cool to zoom in over time!

And in general think about groups of countries here, any geog patterns
Low: Scandinavian and east north, and capitalistic US and Singapore; hi lat am but also Eastern Europe

geog maps like these ingleharts-welzel maps:
https://en.wikipedia.org/wiki/Inglehart%E2%80%9393Welzel_cultural_map_of_the_world
And that graph over time self actualization:
Fig1c:
<https://scholarship.libraries.rutgers.edu/esploro/outputs/acceptedManuscript/Livability-and-Subjective-Wellbeing-Across-European/991031549915704646>

P21 cross level interactions, your country n=48, should be at least 70, probably country missing data, just take average of 10yrs and or impute
Again relax assumption of linearity:

Instead
c.autonomy##c.countryVar
Do:
i.autonomy##c.countryVar

Being devil's advocate: maybe it's not autonomy but something close that both drives it and preferences for redistribution:
-personal responsibility, (protestant) work ethic, hard work, etc
-Succeeds, eg income satisfaction does make results weaker and arguably predicts both autonomy and preferences for redistribution
-personality, and I saw some vars in WVS I think
-culture, individualism v collectivism, nature mastery, power distance, etc

Again need to see papers for predictors of preferences for redistribution (alesina again)

The dark side of autonomy 2 pptx

I started with this one and modeling my analysis after this incl vars, and have some more vars ideas in Feb 20 sec of som.pdf

MPI Praesi pptx

I like intrinsic instrumental moderating

I like controls health disability social connectedness

"Evaluate current economic system as fair" sounds like system justification theory Napier and Jost

State of the art docx

Just Some nuances maybe to think about, overall makes sense and agreed

"While lower-class individuals' orientation toward the world is characterized as more contextual and externally oriented, upper-class individuals' orientation is more solipsistic and individualistic." --Then difficult to explain why Latinos so high on autonomy as there is mostly shades of poverty, very little middle class and miniscule upper class

'The lives of lower-class individuals are often characterized by diminished resources and greater uncertainty (e.g., unsafe neighborhoods, job insecurity), which constrain opportunities and freedom of choice and make them more exposed to--and dependent on--external influences outside their control"-- but many poor are quite well socially connected help each other, while take US middle class disconnected socially and alienated like take for instance US suburbs--fake, alienated, stressed, etc

Yes totally lower classes do seem to be way more communal and prosocial.

"[The question now is: is it the material circumstances that shape the link between social class and economic attitudes or is it the autonomy that people have over their lives?]"--right need a bunch of controls

"social class position is not necessarily determinative of individuals' sense of control, power, and autonomy (Kraus et al., 2010). A lower-class individual can thus still perceive a substantial degree of autonomy to lead a life in accordance with their goals and values and may also exercise power over others, for instance in their occupation" yes exactly eg poor autonomous happy farmer or fisherman v rich alienated stressed manager

See if can control for occupation or industry

3 feb19 [meet] revisit: more useful vars; initial results

3.1 vars

freedom/autonomy:

A173 How much freedom of choice and control

Some people feel they have completely free choice and control over their lives, while other people feel that what they do has no real effect on what happens to them. Please use

this scale where 1 means "none at all" and 10 means "a great deal" to indicate how much freedom of choice and control you feel you have over the way your life turns out.

maybe these ones in the future [all waves]? not for now missing (or very few maybe) in wave7

"People have different views about themselves and how they relate to the world. Using this card, would you tell me how strongly you agree or disagree with each of the following statements about how you see yourself? I see myself as an autonomous individual; 1 Strongly disagree; 4 Strongly agree"

aut autonomous individual

Table 3: OLS regressions of gov more responsibility (v ppl take care of themselves).

a1: ok more autonomy by 1 on 1-10, want less redistrib by .13 on 1-10 scale

a1cc: adding country dummies doesnt change anything

a1satFin: reduced by almost half!, note satFin correlates with agency at .33

a2: basic sociodemographics, and effect size still large at .1

then interactions: [TODO marginsplot whats net, non-interacted terms large coeffs]

a3: freedom * financial satisfaction—interesting while satFin alone less redistribution; interacted with autonomy, the more preRed

a4: with income also positive [rich assholes more for redistribution?]

a5: nothing with male [aggressive males more for redistribution?]

Table 4: OLS regressions of gov more responsibility (v ppl take care of themselves).

one contribution to dummy out like in my papers :)

easy to see big effects by 1 on over 5 or 6 on free—over 5 smaller changes, also first three almost no change, and then jump at 4 and then some on 5 and 6—shows nonlinearity; and i guess also confirms leonie's point of “double barreled” ie can split in half autonomy var, and here this shows that it splits about in half at 5 or 6

b2: still around 1

b3: lower, but .7 is sizeable

3.2.1 by country

i'm a geographer so lets do by country

interesting thing i found in my freedom from and freedom to paper 10 years ago is that more freedom/autonomy in MEX than USA, but can also do effects by countries

another contribution by c, like my cities paper: <https://www.sciencedirect.com/science/article/pii/S0264275121002687?via%3Dihub>

here a quick exercise, just separately by capitalistic/alienated/western c about .15-3 v humanistic/social/latin c about 0-.1—clear differences 4 fold! say .5 v 2; and they hold controlling for basic sociodemographics

some surprises: in BRA positive!; DEU close to 0, but not in AUS; european ARG close to capitalistic/west; and LBN and CZE

big for some reason like .3
